The Comprehensive LaTeX Symbol List

Scott Pakin <scott+clsl@pakin.org>*

9 November 2009

Abstract

This document lists 5913 symbols and the corresponding LaTeX commands that produce them. Some of these symbols are guaranteed to be available in every LaTeX 2ε system; others require fonts and packages that may not accompany a given distribution and that therefore need to be installed. All of the fonts and packages used to prepare this document—as well as this document itself—are freely available from the Comprehensive TeX Archive Network (http://www.ctan.org/).

Contents

*The original version of this document was written by David Carlisle, with several additional tables provided by Alexander Holt. See Section 8.8 on page 118 for more information about who did what.

1 Introduction

Welcome to the Comprehensive LaTeX Symbol List! This document strives to be your primary source of LaTeX symbol information: font samples, LaTeX commands, packages, usage details, caveats—everything needed to put thousands of different symbols at your disposal. All of the fonts covered herein meet the following criteria:

1. They are freely available from the Comprehensive TeX Archive Network (`http://www.ctan.org`).
2. All of their symbols have LaTeX 2_ε bindings. That is, a user should be able to access a symbol by name, not just by `\char`⟨*number*⟩.

These are not particularly limiting criteria; the Comprehensive LaTeX Symbol List contains samples of 5913 symbols—quite a large number. Some of these symbols are guaranteed to be available in every LaTeX 2_ε system; others require fonts and packages that may not accompany a given distribution and that therefore need to be installed. See `http://www.tex.ac.uk/cgi-bin/texfaq2html?label=instpackages+wherefiles` for help with installing new fonts and packages.

1.1 Document Usage

Each section of this document contains a number of font tables. Each table shows a set of symbols, with the corresponding LaTeX command to the right of each symbol. A table's caption indicates what package needs to be loaded in order to access that table's symbols. For example, the symbols in Table 39, "textcomp Old-Style Numerals", are made available by putting "`\usepackage{textcomp}`" in your document's preamble. "$\mathcal{AMS}$" means to use the $\mathcal{AMS}$ packages, viz. amssymb and/or amsmath. Notes below a table provide additional information about some or all the symbols in that table.

One note that appears a few times in this document, particularly in Section 2, indicates that certain symbols do not exist in the OT1 font encoding (Donald Knuth's original, 7-bit font encoding, which is the default font encoding for LaTeX) and that you should use fontenc to select a different encoding, such as T1 (a common 8-bit font encoding). That means that you should put "`\usepackage[`⟨*encoding*⟩`]{fontenc}`" in your document's preamble, where ⟨*encoding*⟩ is, e.g., `T1` or `LY1`. To limit the change in font encoding to the current group, use "`\fontencoding{`⟨*encoding*⟩`}\selectfont`".

Section 8 contains some additional information about the symbols in this document. It discusses how certain mathematical symbols can vary in height, shows which symbol names are not unique across packages, gives examples of how to create new symbols out of existing symbols, explains how symbols are spaced in math mode, compares various schemes for boldfacing symbols, presents LaTeX ASCII and Latin 1 tables, shows how to input and output Unicode characters, and provides some information about this document itself. The Comprehensive LaTeX Symbol List ends with an index of all the symbols in the document and various additional useful terms.

1.2 Frequently Requested Symbols

There are a number of symbols that are requested over and over again on `comp.text.tex`. If you're looking for such a symbol the following list will help you find it quickly.

2 Body-text symbols

This section lists symbols that are intended for use in running text, such as punctuation marks, accents, ligatures, and currency symbols.

TABLE 1: LaTeX 2ε Escapable "Special" Characters

$	\$	%	\%	_	_*	}	\}	&	\&	#	\#	{	\{

* The underscore package redefines "_" to produce an underscore in text mode (i.e., it makes it unnecessary to escape the underscore character).

TABLE 2: Predefined LaTeX 2ε Text-mode Commands

	^	\textasciicircum*		<	\textless
	~	\textasciitilde*	a	a	\textordfeminine
	*	\textasteriskcentered	o	o	\textordmasculine
	\	\textbackslash		¶	\textparagraph†
	|	\textbar		·	\textperiodcentered
	{	\textbraceleft†		¿	\textquestiondown
	}	\textbraceright†		“	\textquotedblleft
	•	\textbullet		”	\textquotedblright
©	©	\textcopyright†		‘	\textquoteleft
	†	\textdagger†		’	\textquoteright
	‡	\textdaggerdbl†	®	®	\textregistered
	$	\textdollar†		§	\textsection†
	...	\textellipsis†		£	\textsterling†
	—	\textemdash	TM	™	\texttrademark
	–	\textendash		_	\textunderscore†
	¡	\textexclamdown		␣	\textvisiblespace
	>	\textgreater			

Where two symbols are present, the left one is the "faked" symbol that LaTeX 2ε provides by default, and the right one is the "true" symbol that textcomp makes available.

* \^{} and \~{} can be used instead of \textasciicircum and \textasciitilde. See the discussion of "~" on page 115.

† It's generally preferable to use the corresponding symbol from Table 3 because the symbols in that table work properly in both text mode and math mode.

TABLE 3: LaTeX 2ε Commands Defined to Work in Both Math and Text Mode

$	\$	_	_	‡	\ddag	{	\{
¶	\P	©	©	\copyright	...	\dots	}	\}
§	\S	†	\dag	£	\pounds		

Where two symbols are present, the left one is the "faked" symbol that LaTeX 2ε provides by default, and the right one is the "true" symbol that textcomp makes available.

Table 4: $\mathcal{AMS}$ Commands Defined to Work in Both Math and Text Mode

✓	\checkmark	®	\circledR	✠	\maltese

Table 5: Non-ASCII Letters (Excluding Accented Letters)

å	\aa	Đ	\DH*	Ł	\L	ø	\o	ß	\ss
Å	\AA	ð	\dh*	ł	\l	Ø	\O	SS	\SS
Æ	\AE	Đ	\DJ*	Ŋ	\NG*	Œ	\OE	Þ	\TH*
æ	\ae	đ	\dj*	ŋ	\ng*	œ	\oe	þ	\th*

* Not available in the OT1 font encoding. Use the fontenc package to select an alternate font encoding, such as T1.

Table 6: Letters Used to Typeset African Languages

Đ	\B{D}	ƈ	\m{c}	ʃ	\m{f}	ƙ	\m{k}	ţ	\M{t}	Ʒ	\m{Z}
đ	\B{d}	Ɗ	\m{D}	Ƒ	\m{F}	Ɲ	\m{N}	Ƭ	\M{T}	Ɛ̃	\T{E}
Ħ	\B{H}	ɖ	\M{d}	Ɣ	\m{G}	ŋ	\m{n}	ƭ	\m{t}	ɛ̃	\T{e}
ħ	\B{h}	Ð	\M{D}	ɣ	\m{g}	ɔ	\m{o}	Ʈ	\m{T}	Ɔ̃	\T{O}
ŧ	\B{t}	ƒ	\m{d}	Ɩ	\m{I}	Ɔ	\m{O}	ʊ	\m{u}*	ɔ̃	\T{o}
Ŧ	\B{T}	Ɛ	\m{E}	ɩ	\m{i}	Ƥ	\m{P}	Ʊ	\m{U}*		
ɓ	\m{b}	ɛ	\m{e}	Ɲ	\m{J}	ƥ	\m{p}	Ƴ	\m{Y}		
Ɓ	\m{B}	Ǝ	\M{E}	ɲ	\m{j}	ʃ	\m{s}	ƴ	\m{y}		
Ƈ	\m{C}	ə	\M{e}	Ƙ	\m{K}	Ʃ	\m{S}	ʒ	\m{z}		

These characters all need the T4 font encoding, which is provided by the fc package.

* \m{v} and \m{V} are synonyms for \m{u} and \m{U}.

Table 7: Letters Used to Typeset Vietnamese

Ơ	\OHORN	ơ	\ohorn	Ư	\UHORN	ư	\uhorn

These characters all need the T5 font encoding, which is provided by the vntex package.

Table 8: Punctuation Marks Not Found in OT1

«	\guillemotleft	‹	\guilsinglleft	„	\quotedblbase	"	\textquotedbl
»	\guillemotright	›	\guilsinglright	‚	\quotesinglbase		

To get these symbols, use the fontenc package to select an alternate font encoding, such as T1.

Table 9: pifont Decorative Punctuation Marks

* Requires the textcomp package.

† Not available in the OT1 font encoding. Use the fontenc package to select an alternate font encoding, such as T1.

‡ Requires the T4 font encoding, provided by the fc package.

§ Requires the T5 font encoding, provided by the vntex package.

Also note the existence of \i and \j, which produce dotless versions of “i” and “j” (viz., “ı” and “ȷ”). These are useful when the accent is supposed to replace the dot in encodings that need to composite (i.e., combine) letters and accents. For example, “na\"{\i}ve” always produces a correct “naïve”, while “na\"{i}ve” yields the rather odd-looking “naïve” when using the OT1 font encoding and older versions of LaTeX. Font encodings other than OT1 and newer versions of LaTeX properly typeset “na\"{i}ve” as “naïve”.

A̠a̠	`\underarch{A}\underarch{a}`

Table 21: phonetic Text-mode Accents

A̠a̠	`\hill{A}\hill{a}`	A̡a̡	`\rc{A}\rc{a}`	A̪a̪	`\ut{A}\ut{a}`
A̹a̹	`\od{A}\od{a}`	A̡a̡	`\syl{A}\syl{a}`		
Â̠â̠	`\ohill{A}\ohill{a}`	A̤a̤	`\td{A}\td{a}`		

The phonetic package provides a few additional macros for linguistic accents. `\acbar` and `\acarc` compose characters with multiple accents; for example, `\acbar{\'}{a}` produces "ā́" and `\acarc{\"}{e}` produces "ë̆". `\labvel` joins two characters with an arc: `\labvel{mn}` → "m͡n". `\upbar` is intended to go between characters as in "`x\upbar{}y''` → "x↑y". Lastly, `\uplett` behaves like `\textsuperscript` but uses a smaller font. Contrast "`p\uplett{h}''` → "pʰ" with "`p\textsuperscript{h}''` → "pʰ".

Áá	`\acutus{A}\acutus{a}`
Ăă	`\breve{A}\breve{a}`
Ãã	`\circumflexus{A}\circumflexus{a}`
Ää	`\diaeresis{A}\diaeresis{a}`
Àà	`\gravis{A}\gravis{a}`
Āā	`\macron{A}\macron{a}`

TABLE 23: t4phonet Text-mode Accents

Ä̏ä̏	`\textdoublegrave{A}\textdoublegrave{a}`
Å̡å̡	`\textvbaraccent{A}\textvbaraccent{a}`
Ä̡ä̡	`\textdoublevbaraccent{A}\textdoublevbaraccent{a}`

The idea behind the t4phonet package's text-mode accents is to provide an interface to some of the accents in the T4 font encoding (accents marked with "‡" in Table 17 on page 14) but using the same names as the tipa accents presented in Table 18 on page 15.

TABLE 24: arcs Text-mode Accents

$\widehat{\text{Aa}}$	`\overarc{A}\overarc{a}`	$\underset{\frown}{\text{Aa}}$	`\underarc{A}\underarc{a}`

The accents shown above scale only to a few characters wide. An optional macro argument alters the effective width of the accented characters. See the arcs documentation for more information.

TABLE 25: semtrans Accents

A̤a̤	`\D{A}\D{a}`	A̬a̬	`\U{A}\U{a}`

Vɐ	`\T{A}\T{a}`*

`\T` is not actually an accent but a command that rotates its argument 180° using the graphicx package's `\rotatebox` command.

TABLE 26: ogonek Accents

Ąą	`\k{A}\k{a}`

TABLE 27: combelow Accents

Ạạ	`\cb{A}\cb{a}`

`\cb` places a comma *above* letters with descenders. Hence, while "`\cb{s}`" produces "ș", "`\cb{g}`" produces "ģ".

Table 28: wsuipa Diacritics

ʿ	\ain	˂	\leftp	˚	\overring	ˈ	\stress	ˬ	\underwedge
˥	\corner	˩	\leftt	˛	\polishhook	ˌ	\syllabic	˄	\upp
˅	\downp	ː	\length	˃	\rightp	¨	\underdots	˫	\upt
˧	\downt	~	\midtilde	˪	\rightt	˚	\underring		
ˈ	\halflength	˷	\open	ˌ	\secstress	~	\undertilde		

The wsuipa package defines all of the above as ordinary characters, not as accents. However, it does provide \diatop and \diaunder commands, which are used to compose diacritics with other characters. For example, \diatop[\overring|a] produces "å", and \diaunder[\underdots|a] produces "a̤". See the wsuipa documentation for more information.

Table 29: textcomp Diacritics

˝	\textacutedbl	ˇ	\textasciicaron	¯	\textasciimacron
´	\textasciiacute	¨	\textasciidieresis	‵	\textgravedbl
˘	\textasciibreve	`	\textasciigrave		

The textcomp package defines all of the above as ordinary characters, not as accents.

Table 30: textcomp Currency Symbols

฿	\textbaht	$	\textdollar*	₲	\textguarani	₩	\textwon
¢	\textcent	$	\textdollaroldstyle	£	\textlira	¥	\textyen
¢	\textcentoldstyle	₫	\textdong	₦	\textnaira		
₡	\textcolonmonetary	€	\texteuro	₱	\textpeso		
¤	\textccurrency	f	\textflorin	£	\textsterling*		

* It's generally preferable to use the corresponding symbol from Table 3 on page 9 because the symbols in that table work properly in both text mode and math mode.

Table 31: marvosym Currency Symbols

\Denarius	€	\EUR	\EURdig	\EURtm	\Pfund
\Ecommerce		\EURcr	\EURhv	\EyesDollar	\Shilling

The different euro signs are meant to be visually compatible with different fonts—Courier (\EURcr), Helvetica (\EURhv), Times Roman (\EURtm), and the marvosym digits listed in Table 197 (\EURdig). The mathdesign package redefines \texteuro to be visually compatible with one of three additional fonts: Utopia (€), Charter (€), or Garamond (€).

Table 32: wasysym Currency Symbols

¢	\cent	¤	\currency

Table 33: GNHTA2e Currency Symbols

€	\Euro	₡	\Pound

Table 34: teubner Currency Symbols

⟀	\denarius	ↄ	\hemiobelion	Ↄ	\tetartemorion
⊢	\dracma	⚡	\stater		

Table 35: eurosym Euro Signs

€	\geneuro	€	\geneuronarrow	€	\geneurowide	€	\officialeuro

\euro is automatically mapped to one of the above—by default, \officialeuro—based on a eurosym package option. See the eurosym documentation for more information. The \geneuro... characters are generated from the current body font's "C" character and therefore may not appear exactly as shown.

Table 36: fourier Euro Signs

€	\eurologo	€	\texteuro

Table 37: textcomp Legal Symbols

Ⓟ	\textcircledP	©	©	\textcopyright	℠	℠	\textservicemark
ↄ	\textcopyleft	®	®	\textregistered	™	™	\texttrademark

Where two symbols are present, the left one is the "faked" symbol that LaTeX 2ε provides by default, and the right one is the "true" symbol that textcomp makes available.

See http://www.tex.ac.uk/cgi-bin/texfaq2html?label=tradesyms for solutions to common problems that occur when using these symbols (e.g., getting a "ⓡ" when you expected to get a "®").

Table 38: cclicenses Creative Commons License Icons

🅭	\cc	🅯	\ccby	🅮	\ccnc*	🅰	\ccnd	🅱	\ccsa*

* These symbols utilize the rotating package and therefore display improperly in some DVI viewers.

Table 39: textcomp Old-style Numerals

0	\textzerooldstyle	4	\textfouroldstyle	8	\texteightoldstyle
1	\textoneoldstyle	5	\textfiveoldstyle	9	\textnineoldstyle
2	\texttwooldstyle	6	\textsixoldstyle		
3	\textthreeoldstyle	7	\textsevenoldstyle		

Rather than use the bulky \textoneoldstyle, \texttwooldstyle, etc. commands shown above, consider using \oldstylenums{...} to typeset an old-style number.

Table 40: Miscellaneous textcomp Symbols

*	\textasteriskcentered	a	a	\textordfeminine
‖	\textbardbl	o	o	\textordmasculine
◯	\textbigcircle		¶	\textparagraph*
ƀ	\textblank		·	\textperiodcentered
¦	\textbrokenbar		‰	\textpertenthousand
•	\textbullet		‰	\textperthousand
†	\textdagger*		¶	\textpilcrow
‡	\textdaggerdbl*		'	\textquotesingle
‧	\textdblhyphen		‚	\textquotestraightbase
‧	\textdblhyphenchar		„	\textquotestraightdblbase
⁒	\textdiscount		℞	\textrecipe
℮	\textestimated		※	\textreferencemark
⁉	\textinterrobang		§	\textsection*
⸘	\textinterrobangdown		—	\textthreequartersemdash
♪	\textmusicalnote		~	\texttildelow
№	\textnumero		—	\texttwelveudash
○	\textopenbullet			

Where two symbols are present, the left one is the "faked" symbol that LaTeX 2ε provides by default, and the right one is the "true" symbol that textcomp makes available.

* It's generally preferable to use the corresponding symbol from Table 3 on page 9 because the symbols in that table work properly in both text mode and math mode.

Table 41: Miscellaneous wasysym Text-mode Symbols

‰	\permil

3 Mathematical symbols

Most, but not all, of the symbols in this section are math-mode only. That is, they yield a "`Missing $ inserted`" error message if not used within `$`...`$`, `\[`...`\]`, or another math-mode environment. Operators marked as "variable-sized" are taller in displayed formulas, shorter in in-text formulas, and possibly shorter still when used in various levels of superscripts or subscripts.

Alphanumeric symbols (e.g., "$\mathscr{L}$" and "$\mathbb{Z}$") are usually produced using one of the math alphabets in Table 213 rather than with an explicit symbol command. Look there first if you need a symbol for a transform, number set, or some other alphanumeric.

Although there have been many requests on `comp.text.tex` for a contradiction symbol, the ensuing discussion invariably reveals innumerable ways to represent contradiction in a proof, including "↯" (`\blitza`), "⇒⇐" (`\Rightarrow\Leftarrow`), "⊥" (`\bot`), "↮" (`\nleftrightarrow`), and "※" (`\textreferencemark`). Because of the lack of notational consensus, it is probably better to spell out "Contradiction!" than to use a symbol for this purpose. Similarly, discussions on `comp.text.tex` have revealed that there are a variety of ways to indicate the mathematical notion of "is defined as". Common candidates include "$\triangleq$" (`\triangleq`), "$\equiv$" (`\equiv`), "$:=$" (*various*[1]), and "$\stackrel{\text{def}}{=}$" (`\stackrel{\text{\tiny def}}{=}`). See also the example of `\equalsfill` on page 108. Depending upon the context, disjoint union may be represented as "$\coprod$" (`\coprod`), "$\sqcup$" (`\sqcup`), "$\cup$" (`\dotcup`), "$\oplus$" (`\oplus`), or any of a number of other symbols.[2] Finally, the average value of a variable x is written by some people as "$\overline{x}$" (`\overline{x}`), by some people as "$\langle x \rangle$" (`\langle x \rangle`), and by some people as "$\varnothing x$" or "$\varnothing x$" (`\diameter x` or `\varnothing x`). The moral of the story is that you should be careful always to explain your notation to avoid confusing your readers.

Table 42: Math-Mode Versions of Text Symbols

$	`\mathdollar`	¶	`\mathparagraph`	£	`\mathsterling`
…	`\mathellipsis`	§	`\mathsection`	_	`\mathunderscore`

It's generally preferable to use the corresponding symbol from Table 3 on page 9 because the symbols in that table work properly in both text mode and math mode.

Table 43: cmll Unary Operators

!	`\oc`*	↑	`\shneg`	?	`\wn`*
↕	`\shift`	↓	`\shpos`		

* `\oc` and `\wn` differ from "!" and "?" in terms of their math-mode spacing: `$A=!B$` produces "$A =!B$", for example, while `$A=\oc B$` produces "$A = !B$".

[1] In txfonts, pxfonts, and mathtools the symbol is called `\coloneqq`. In mathabx and MnSymbol it's called `\coloneq`. In colonequals it's called `\colonequals`.

[2] Bob Tennent listed these and other disjoint-union symbol possibilities in a November 2007 post to `comp.text.tex`.

TABLE 44: Binary Operators

∐	\amalg	∪	\cup	⊕	\oplus	×	\times
∗	\ast	†	\dagger	⊘	\oslash	◁	\triangleleft
◯	\bigcirc	‡	\ddagger	⊗	\otimes	▷	\triangleright
▽	\bigtriangledown	⋄	\diamond	±	\pm	⊴	\unlhd*
△	\bigtriangleup	÷	\div	▷	\rhd*	⊵	\unrhd*
•	\bullet	◁	\lhd*	\	\setminus	⊎	\uplus
∩	\cap	∓	\mp	⊓	\sqcap	∨	\vee
·	\cdot	⊙	\odot	⊔	\sqcup	∧	\wedge
∘	\circ	⊖	\ominus	⋆	\star	≀	\wr

* Not predefined in LaTeX 2ε. Use one of the packages latexsym, amsfonts, amssymb, txfonts, pxfonts, or wasysym.

TABLE 45: $\mathcal{AMS}$ Binary Operators

⊼	\barwedge	⊚	\circledcirc	⊺	\intercal*
⊡	\boxdot	⊝	\circleddash	⋋	\leftthreetimes
⊟	\boxminus	⋓	\Cup	⋉	\ltimes
⊞	\boxplus	⋎	\curlyvee	⋌	\rightthreetimes

⋒	\Cap	⋇	\divideontimes	∖	\smallsetminus
∙	\centerdot	∔	\dotplus	⩒	\veebar
⊛	\circledast	⩛	\doublebarwedge		

* Some people use a superscripted \intercal for matrix transpose: "A^\intercal" ↦ "$A^{\intercal}$". (See the May 2009 comp.text.tex thread, "raising math symbols", for suggestions about altering the height of the superscript.) \top (Table 139 on page 51), T, and \mathsf{T} are other popular choices: "$A^{\top}$", "A^{T}", "A^{T}".

TABLE 46: stmaryrd Binary Operators

⧶	\baro	⫴	\interleave	⊛	\varoast
⫽	\bbslash	◅	\leftslice	⦶	\varobar

* Not predefined in LaTeX 2_ε. Use one of the packages latexsym, amsfonts, amssymb, mathabx, txfonts, pxfonts, or wasysym.

† The difference between \mid and | is that the former is a binary relation while the latter is a math ordinal. Consequently, LaTeX typesets the two with different surrounding spacing. Contrast "P(A | B)" ↦ "$P(A|B)$" with "P(A \mid B)" ↦ "$P(A \mid B)$".

The \changenotsign command toggles the behavior of \not to produce either a vertical or a diagonal slash through a binary operator. Thus, "$a \not= b$" can be made to produce either "$a \neq b$" or "$a \neq b$".

TABLE 100: mathabx Triangle Relations

⋪	\ntriangleleft	⋫	\ntrianglerighteq	⊳	\triangleright	⊳	\vartriangleright
⋬	\ntrianglelefteq	⊲	\triangleleft	⋭	\trianglerighteq		
⋫	\ntriangleright	⋬	\trianglelefteq	⊲	\vartriangleleft		

TABLE 101: MnSymbol Triangle Relations

▼	\filledmedtriangledown	△	\largetriangleup	▿	\smalltriangledown
◀	\filledmedtriangleleft	▽	\medtriangledown	◃	\smalltriangleleft
▶	\filledmedtriangleright	◁	\medtriangleleft	▹	\smalltriangleright
▲	\filledmedtriangleup	▷	\medtriangleright	▵	\smalltriangleup
▾	\filledtriangledown	△	\medtriangleup	≜	\triangleeq
◂	\filledtriangleleft	≠	\ntriangleeq	⊴	\trianglelefteq
▸	\filledtriangleright	⋪	\ntriangleleft	⊵	\trianglerighteq
▴	\filledtriangleup	⋬	\ntrianglelefteq	◁	\vartriangleleft
▽	\largetriangledown	⋫	\ntriangleright	▷	\vartriangleright
◁	\largetriangleleft	⋭	\ntrianglerighteq		
▷	\largetriangleright	⟁	\otriangle		

MnSymbol additionally defines synonyms for many of the preceding symbols: \triangleq is a synonym for \triangleeeq; \lhd and \lessclosed are synonyms for \vartriangleleft; \rhd and \gtrclosed are synonyms for \vartriangleright; \unlhd and \leqclosed are synonyms for \trianglelefteq; \unrhd and \geqclosed are synonyms for \trianglerighteq; \blacktriangledown, \blacktriangleleft, \blacktriangleright, and \blacktriangle [*sic*] are synonyms for, respectively, \filledmedtriangledown, \filledmedtriangleleft, \filledmedtriangleright, and \filledmedtriangleup; \triangleright is a synonym for \medtriangleright; \triangle, \vartriangle, and \bigtriangleup are synonyms for \medtriangleup; \triangleleft is a synonym for \medtriangleleft; \triangledown and \bigtriangledown are synonyms for \medtriangledown; \nlessclosed is a synonym for \ntriangleleft; \ngtrclosed is a synonym for \ntriangleright; \nleqclosed is a synonym for \ntrianglelefteq; and \ngeqclosed is a synonym for \ntrianglerighteq.

The title "Triangle Relations" is a bit of a misnomer here as only \triangleeeq and \ntriangleeeq are defined as TEX relations (class 3 symbols). The \largetriangle... symbols are defined as TEX "ordinary" characters (class 0) and all of the remaining characters are defined as TEX binary operators (class 2).

Table 102: Arrows

Table 127: mathabx Extension Characters

	\mapsfromchar		\mapstochar
	\Mapsfromchar		\Mapstochar

Table 128: Log-like Symbols

\arccos	\cos	\csc	\exp	\ker	\limsup	\min	\sinh
\arcsin	\cosh	\deg	\gcd	\lg	\ln	\Pr	\sup
\arctan	\cot	\det	\hom	\lim	\log	\sec	\tan
\arg	\coth	\dim	\inf	\liminf	\max	\sin	\tanh

Calling the above "symbols" may be a bit misleading.[3] Each log-like symbol merely produces the eponymous textual equivalent, but with proper surrounding spacing. See Section 8.4 for more information about log-like symbols. As \bmod and \pmod are arguably not symbols we refer the reader to the Short Math Guide for LaTeX [Dow00] for samples.

Table 129: $\mathcal{AMS}$ Log-like Symbols

inj lim	\injlim	$\varinjlim$	\varinjlim	$\varlimsup$	\varlimsup
proj lim	\projlim	$\varliminf$	\varliminf	$\varprojlim$	\varprojlim

Load the amsmath package to get these symbols. See Section 8.4 for some additional comments regarding log-like symbols. As \mod and \pod are arguably not symbols we refer the reader to the Short Math Guide for LaTeX [Dow00] for samples.

Table 130: GNU FreeFont A2e Number Sets

$\mathbb{C}$	\Complex	$\mathbb{Z}$	\Integer	$\mathbb{N}$	\Natural	$\mathbb{Q}$	\Rational	$\mathbb{R}$	\Real
$\mathbb{C}$	\COMPLEX	$\mathbb{Z}$	\INTEGER	$\mathbb{N}$	\NATURAL	$\mathbb{Q}$	\RATIONAL	$\mathbb{R}$	\REAL

[3] Michael J. Downes prefers the more general term, "atomic math objects".

Table 131: Greek Letters

α	\alpha	θ	\theta	o	o	τ	\tau
β	\beta	ϑ	\vartheta	π	\pi	υ	\upsilon
γ	\gamma	ι	\iota	ϖ	\varpi	ϕ	\phi
δ	\delta	κ	\kappa	ρ	\rho	φ	\varphi
ϵ	\epsilon	λ	\lambda	ϱ	\varrho	χ	\chi
ε	\varepsilon	μ	\mu	σ	\sigma	ψ	\psi
ζ	\zeta	ν	\nu	ς	\varsigma	ω	\omega
η	\eta	ξ	\xi				
Γ	\Gamma	Λ	\Lambda	Σ	\Sigma	Ψ	\Psi
Δ	\Delta	Ξ	\Xi	Υ	\Upsilon	Ω	\Omega
Θ	\Theta	Π	\Pi	Φ	\Phi		

The remaining Greek majuscules can be produced with ordinary Latin letters. The symbol "M", for instance, is used for both an uppercase "m" and an uppercase "μ".

See Section 8.5 for examples of how to produce bold Greek letters.

The symbols in this table are intended to be used in mathematical typesetting. Greek body text can be typeset using the babel package's greek (or polutonikogreek) option—and, of course, a font that provides the glyphs for the Greek alphabet.

Table 132: $\mathcal{AMS}$ Greek Letters

$\digamma$	\digamma	$\varkappa$	\varkappa

Table 133: txfonts/pxfonts Upright Greek Letters

α	\alphaup	θ	\thetaup	π	\piup	ϕ	\phiup
β	\betaup	ϑ	\varthetaup	ϖ	\varpiup	φ	\varphiup
γ	\gammaup	ι	\iotaup	ρ	\rhoup	χ	\chiup
δ	\deltaup	κ	\kappaup	ϱ	\varrhoup	ψ	\psiup
ϵ	\epsilonup	λ	\lambdaup	σ	\sigmaup	ω	\omegaup
ε	\varepsilonup	μ	\muup	ς	\varsigmaup		
ζ	\zetaup	ν	\nuup	τ	\tauup		
η	\etaup	ξ	\xiup	υ	\upsilonup		

Table 134: upgreek Upright Greek Letters

$\upalpha$	\upalpha	$\uptheta$	\uptheta	$\uppi$	\uppi	$\upphi$	\upphi
$\upbeta$	\upbeta	$\upvartheta$	\upvartheta	$\upvarpi$	\upvarpi	$\upvarphi$	\upvarphi
$\upgamma$	\upgamma	$\upiota$	\upiota	$\uprho$	\uprho	$\upchi$	\upchi
$\updelta$	\updelta	$\upkappa$	\upkappa	$\upvarrho$	\upvarrho	$\uppsi$	\uppsi
$\upepsilon$	\upepsilon	$\uplambda$	\uplambda	$\upsigma$	\upsigma	$\upomega$	\upomega
$\upvarepsilon$	\upvarepsilon	$\upmu$	\upmu	$\upvarsigma$	\upvarsigma		
$\upzeta$	\upzeta	$\upnu$	\upnu	$\uptau$	\uptau		
$\upeta$	\upeta	$\upxi$	\upxi	$\upupsilon$	\upupsilon		
$\Upgamma$	\Upgamma	$\Uplambda$	\Uplambda	$\Upsigma$	\Upsigma	$\Uppsi$	\Uppsi
$\Updelta$	\Updelta	$\Upxi$	\Upxi	$\Upupsilon$	\Upupsilon	$\Upomega$	\Upomega
$\Uptheta$	\Uptheta	$\Uppi$	\Uppi	$\Upphi$	\Upphi		

upgreek utilizes upright Greek characters from either the PostScript Symbol font (depicted above) or Euler Roman. As a result, the glyphs may appear slightly different from the above. Contrast, for example, "$\Gamma\Delta\Theta\alpha\beta\gamma$" (Symbol) with "$\Gamma\Delta\Theta\alpha\beta\gamma$" (Euler).

Table 135: fourier Variant Greek Letters

π	\pi	ρ	\rho
ϖ	\varpi	ϱ	\varrho
ϖ	\varvarpi	ϱ	\varvarrho

Table 136: txfonts/pxfonts Variant Latin Letters

g	\varg	v	\varv	w	\varw	y	\vary

Pass the varg option to txfonts/pxfonts to replace g, v, w, and y with g, v, w, and y in every mathematical expression in your document.

Table 137: $\mathcal{AMS}$ Hebrew Letters

⌞	\niv	⌟	\vin

Table 152: Variable-sized Delimiters

$\downarrow$	$\left\downarrow\right.$	`\downarrow`	$\Downarrow$	$\left\Downarrow\right.$	`\Downarrow`	[	$\left[\right.$	`[`	]	$\left.\right]$	`]`
$\langle$	$\left\langle\right.$	`\langle`	$\rangle$	$\left.\right\rangle$	`\rangle`	|	$\left\vert\right.$	`|`	$\Vert$	$\left.\right\Vert$	`\\|`
$\lceil$	$\left\lceil\right.$	`\lceil`	$\rceil$	$\left.\right\rceil$	`\rceil`	$\uparrow$	$\left\uparrow\right.$	`\uparrow`	$\Uparrow$	$\left\Uparrow\right.$	`\Uparrow`
$\lfloor$	$\left\lfloor\right.$	`\lfloor`	$\rfloor$	$\left.\right\rfloor$	`\rfloor`	$\updownarrow$	$\left\updownarrow\right.$	`\updownarrow`	$\Updownarrow$	$\left\Updownarrow\right.$	`\Updownarrow`
(	$\left(\right.$	`(`	)	$\left.\right)$	`)`	{	$\left\{\right.$	`\{`	}	$\left.\right\}$	`\}`
/	$\left/\right.$	`/`	\	$\left.\backslash\right.$	`\backslash`						

When used with `\left` and `\right`, these symbols expand to the height of the enclosed math expression. Note that `\vert` is a synonym for `|`, and `\Vert` is a synonym for `\|`.

ε-TeX provides a `\middle` analogue to `\left` and `\right`. `\middle` can be used, for example, to make an internal "|" expand to the height of the surrounding `\left` and `\right` symbols. (This capability is commonly needed when typesetting adjacent bras and kets in Dirac notation: "$\langle\phi|\psi\rangle$"). A similar effect can be achieved in conventional LaTeX using the braket package.

Table 153: Large, Variable-sized Delimiters

$\int$	$\left\int\right.$	`\lmoustache`	$\left.\right\}$	$\left.\right\rmoustache$	`\rmoustache`	(	$\left(\right.$	`\lgroup`	)	$\left.\right)$	`\rgroup`
$\vert$	$\left\vert\right.$	`\arrowvert`	$\Vert$	$\left\Vert\right.$	`\Arrowvert`	$\mid$	$\left\mid\right.$	`\bracevert`			

These symbols *must* be used with `\left` and `\right`. The mathabx package, however, redefines `\lgroup` and `\rgroup` so that those symbols can work without `\left` and `\right`.

Table 154: $\mathcal{AMS}$ Variable-sized Delimiters

|	$\left\vert\right.$	`\lvert`	|	$\left.\right\vert$	`\rvert`
$\Vert$	$\left\Vert\right.$	`\lVert`	$\Vert$	$\left.\right\Vert$	`\rVert`

According to the amsmath documentation [AMS99], the preceding symbols are intended to be used as delimiters (e.g., as in "$|-z|$") while the `\vert` and `\Vert` symbols (Table 152) are intended to be used as operators (e.g., as in "$p|q$").

Table 155: stmaryrd Variable-sized Delimiters

$[\![$	$\left[\!\left[\right.$	`\llbracket`	$]\!]$	$\left.\right]\!]$	`\rrbracket`

TABLE 156: mathabx Variable-sized Delimiters

⟦	⟦	\ldbrack	⟧	⟧	\rdbrack
⧘	⧘	\lfilet	⧙	⧙	\rfilet
|	|	\thickvert	⦀	⦀	\vvvert

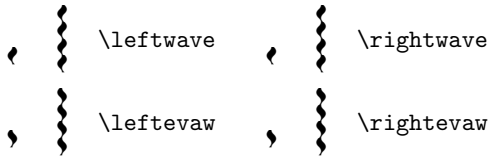
TABLE 157: MnSymbol Variable-sized Delimiters

⌈	⌈	\lceil	⌉	⌉	\rceil
⌊	⌊	\lfloor	⌋	⌋	\rfloor
⦚	⦚	\lwavy	⦚	⦚	\rwavy
⦙	⦙	\lWavy	⦙	⦙	\rWavy
(	(	(	)	)	)
⟦	⟦	\lsem	⟧	⟧	\rsem
⨍	⨍	\lmoustache	⨎	⨎	\rmoustache
/	/	/	\	\	\backslash
[	[	[	]	]	]
|	|	|	‖	‖	\\|
↑	↑	\arrowvert	⇑	⇑	\Arrowvert

⌜	⌜	\ulcorner	⌝	⌝	\urcorner
⌞	⌞	\llcorner	⌟	⌟	\lrcorner
⟨	⟨	\langle	⟩	⟩	\rangle
⧼	⧼	\langlebar	⧽	⧽	\ranglebar
⦇	⦇	\lgroup	⦈	⦈	\rgroup
⟪	⟪	\llangle	⟫	⟫	\rrangle
{	{	\lbrace	}	}	\rbrace
⟨	⟨	<	⟩	⟩	>
⌜	⌜	\ullcorner	⌝	⌝	\ulrcorner
|	|	\bracevert			

`\vert` is a synonym for `|`. `\Vert` is a synonym for `\|`. `\mid` and `\mvert` produce the same symbol as `\vert` but designated as math relations instead of ordinals. `\divides` produces the same symbol as `\vert` but designated as a binary operator instead of an ordinal. `\parallel` and `\mVert` produce the same symbol as `\Vert` but designated as math relations instead of ordinals.

TABLE 158: mathdesign Variable-sized Delimiters



The definitions of these symbols include a preceding `\left` or `\right`. It is therefore an error to specify `\left` or `\right` explicitly. The internal, "primitive" versions of these symbols are called `\lwave`, `\rwave`, `\levaw`, and `\revaw`.

TABLE 159: nath Variable-sized Delimiters (Double)

⟪	⟪	`\lAngle`	⟫	⟫	`\rAngle`
⟦	⟦	`\lBrack`	⟧	⟧	`\rBrack`
⌈	⌈	`\lCeil`	⌉	⌉	`\rCeil`
⌊	⌊	`\lFloor`	⌋	⌋	`\rFloor`
‖	‖	`\lVert`*	‖	‖	`\rVert`*

* nath redefines all of the above to include implicit `\left` and `\right` commands. Hence, separate `\lVert` and `\rVert` commands are needed to disambiguate whether "`|`" is a left or right delimiter.

All of the symbols in Table 159 can also be expressed using the `\double` macro. See the nath documentation for examples and additional information.

Table 160: nath Variable-sized Delimiters (Triple)

⋘	$\left\lll$	`\triple<`	⋙	$\right\ggg$	`\triple>`
⟦⟦	$\left[\!\left[$	`\triple[`	⟧⟧	$\right]\!\right]$	`\triple]`
⦀	$\left\vert\!\left\vert\!\left\vert$	`\ltriple|`*	⦀	$\right\vert\!\right\vert\!\right\vert$	`\rtriple|`*

* Similar to `\lVert` and `\rVert` in Table 159, `\ltriple` and `\rtriple` must be used instead of `\triple` to disambiguate whether "`|`" is a left or right delimiter.

Note that `\triple`—and the corresponding `\double`—is actually a macro that takes a delimiter as an argument.

Table 161: fourier Variable-sized Delimiters

⟦	$\left[\!\left[$	`\llbracket`	⟧	$\right]\!\right]$	`\rrbracket`
⦀	$\left\vert\!\left\vert\!\left\vert$	`\VERT`			

Table 162: textcomp Text-mode Delimiters

⟨	`\textlangle`	⟩	`\textrangle`
⟦	`\textlbrackdbl`	⟧	`\textrbrackdbl`
{	`\textlquill`	}	`\textrquill`

Table 163: metre Text-mode Delimiters

}	`\alad`	}	`\Alad`	†	`\crux`	†	`\Crux`
{	`\alas`	{	`\Alas`	⟧	`\quadrad`	⟧	`\Quadrad`
⟩	`\angud`	⟩	`\Angud`	⟦	`\quadras`	⟦	`\Quadras`
⟨	`\angus`	⟨	`\Angus`				

Table 164: Math-mode Accents

$\acute{a}$	`\acute{a}`	$\check{a}$	`\check{a}`	$\grave{a}$	`\grave{a}`	$\tilde{a}$	`\tilde{a}`
$\bar{a}$	`\bar{a}`	$\ddot{a}$	`\ddot{a}`	$\hat{a}$	`\hat{a}`	$\vec{a}$	`\vec{a}`
$\breve{a}$	`\breve{a}`	$\dot{a}$	`\dot{a}`	$\mathring{a}$	`\mathring{a}`		

Also note the existence of `\imath` and `\jmath`, which produce dotless versions of "i" and "j". (See Table 201 on page 65.) These are useful when the accent is supposed to replace the dot. For example, "`\hat{\imath}`" produces a correct "$\hat{\imath}$", while "`\hat{i}`" would yield the rather odd-looking "$\hat{i}$".

Table 165: $\mathcal{AMS}$ Math-mode Accents

$\ddot{\ddot{a}}$ `\dddot{a}` $\ddot{\ddot{a}}$ `\ddddot{a}`

These accents are also provided by the mathabx and accents packages and are redefined by the mathdots package if the amsmath and amssymb packages have previously been loaded. All of the variations except for the original $\mathcal{AMS}$ ones tighten the space between the dots (from $\ddot{\ddot{a}}$ to $\ddot{\ddot{a}}$). The mathabx and mathdots versions also function properly within subscripts and superscripts ($x^{\ddot{\ddot{a}}}$ instead of $x^{\ddot{\ddot{a}}}$) .

Table 166: MnSymbol Math-mode Accents

$\vec{a}$ `\vec{a}`

Table 167: fge Math-mode Accents

Å̊å `\spirituslenis{A}\spirituslenis{a}`*

* When fge is passed the crescent option, `\spirituslenis` instead uses a crescent accent as in "å̊".

Table 168: yhmath Math-mode Accents

$\mathring{a}$ `\ring{a}`

This symbol is largely obsolete, as standard LaTeX 2_ε has supported `\mathring` since June, 1998 [LaT98].

Table 169: Extensible Accents

$\widetilde{abc}$	`\widetilde{abc}`*	$\widehat{abc}$	`\widehat{abc}`*
$\overleftarrow{abc}$	`\overleftarrow{abc}`†	$\overrightarrow{abc}$	`\overrightarrow{abc}`†
$\overline{abc}$	`\overline{abc}`	$\underline{abc}$	`\underline{abc}`
$\overbrace{abc}$	`\overbrace{abc}`	$\underbrace{abc}$	`\underbrace{abc}`
$\sqrt{abc}$	`\sqrt{abc}`‡		

As demonstrated in a 1997 TUGboat article about typesetting long-division problems [Gib97], an extensible long-division sign ("$\overline{)abc}$") can be faked by putting a "`\big)`" in a `tabular` environment with an `\hline` or `\cline` in the preceding row. The article also presents a piece of code (uploaded to CTAN as `longdiv.tex`) that automatically solves and typesets—by putting an `\overline` atop "`\big)`" and the desired text—long-division problems. See also the polynom package, which automatically solves and typesets polynomial-division problems in a similar manner.

* These symbols are made more extensible by the MnSymbol package and even more extensible by the yhmath package.

† If you're looking for an extensible *diagonal* line or arrow to be used for canceling or reducing mathematical subexpressions (e.g., "$x + \cancel{-x}$" or "$3 + \cancel[\nearrow]{-2}^{5}$") then consider using the cancel package.

‡ With an optional argument, `\sqrt` typesets nth roots. For example, "`\sqrt[3]{abc}`" produces "$\sqrt[3]{abc}$" and "`\sqrt[n]{abc}`" produces "$\sqrt[n]{abc}$".

Table 170: overrightarrow Extensible Accents

$\overRightarrow{abc}$	`\Overrightarrow{abc}`

Table 171: yhmath Extensible Accents

$\wideparen{abc}$	`\wideparen{abc}`	$\widetriangle{abc}$	`\widetriangle{abc}`
$\widering{abc}$	`\widering{abc}`		

Table 172: $\mathcal{AMS}$ Extensible Accents

$\overleftrightarrow{abc}$	`\overleftrightarrow{abc}`	$\underleftrightarrow{abc}$	`\underleftrightarrow{abc}`
$\underleftarrow{abc}$	`\underleftarrow{abc}`	$\underrightarrow{abc}$	`\underrightarrow{abc}`

Table 173: MnSymbol Extensible Accents

$\overbrace{abc}$	`\overbrace{abc}`	$\underbrace{abc}$	`\underbrace{abc}`
$\overgroup{abc}$	`\overgroup{abc}`	$\undergroup{abc}$	`\undergroup{abc}`
$\overlinesegment{abc}$	`\overlinesegment{abc}`	$\underlinesegment{abc}$	`\underlinesegment{abc}`
$\overleftharpoon{abc}$	`\overleftharpoon{abc}`	$\overrightharpoon{abc}$	`\overrightharpoon{abc}`
$\widehat{abc}$	`\widehat{abc}`	$\widetilde{abc}$	`\widetilde{abc}`
$\wideparen{abc}$	`\wideparen{abc}`		

Table 174: mathtools Extensible Accents

$\overbrace{abc}$	`\overbrace{abc}`	$\underbrace{abc}$	`\underbrace{abc}`
$\overbracket{abc}$	`\overbracket{abc}`*	$\underbracket{abc}$	`\underbracket{abc}`*

* `\overbracket` and `\underbracket` accept optional arguments that specify the bracket height and thickness. See the mathtools documentation for more information.

Table 175: mathabx Extensible Accents

$\overbrace{abc}$	`\overbrace{abc}`	$\widebar{abc}$	`\widebar{abc}`
$\overgroup{abc}$	`\overgroup{abc}`	$\widecheck{abc}$	`\widecheck{abc}`
$\underbrace{abc}$	`\underbrace{abc}`	$\wideparen{abc}$	`\wideparen{abc}`
$\undergroup{abc}$	`\undergroup{abc}`	$\widering{abc}$	`\widering{abc}`
$\widearrow{abc}$	`\widearrow{abc}`		

The braces shown for `\overbrace` and `\underbrace` appear in their minimum size. They can expand arbitrarily wide, however.

Table 176: fourier Extensible Accents

$\widearc{abc}$	`\widearc{abc}`	$\wideparen{abc}$	`\wideparen{abc}`
$\wideOarc{abc}$	`\wideOarc{abc}`	$\widering{abc}$	`\widering{abc}`

TABLE 177: esvect Extensible Accents

$\overrightarrow{abc}$	`\vv{abc}` with package option `a`
$\overrightarrow{abc}$	`\vv{abc}` with package option `b`
$\overrightarrow{abc}$	`\vv{abc}` with package option `c`
$\overrightarrow{abc}$	`\vv{abc}` with package option `d`
$\overrightarrow{abc}$	`\vv{abc}` with package option `e`
$\overrightarrow{abc}$	`\vv{abc}` with package option `f`
$\overrightarrow{abc}$	`\vv{abc}` with package option `g`
$\overrightarrow{abc}$	`\vv{abc}` with package option `h`

esvect also defines a `\vv*` macro which is used to typeset arrows over vector variables with subscripts. See the esvect documentation for more information.

TABLE 178: undertilde Extensible Accents

$\underset{\sim}{abc}$	`\utilde{abc}`

Because `\utilde` is based on `\widetilde` it is also made more extensible by the yhmath package.

TABLE 179: ushort Extensible Accents

$\underline{\underline{abc}}$	`\ushortdw{abc}`	$\underline{abc}$	`\ushortw{abc}`

`\ushortw` and `\ushortdw` are intended to be used with multi-character arguments ("words") while `\ushort`and `\ushortd` are intended to be used with single-character arguments.

The underlines produced by the ushort commands are shorter than those produced by the `\underline` command. Consider the output from the expression "`\ushort{x}\ushort{y}\underline{x}\underline{y}`", which looks like "$\underline{x}\underline{y}\underline{x}\underline{y}$".

TABLE 180: $\mathcal{AMS}$ Extensible Arrows

$\xleftarrow{abc}$	`\xleftarrow{abc}`	$\xrightarrow{abc}$	`\xrightarrow{abc}`

Table 181: mathtools Extensible Arrows

$\xhookleftarrow{abc}$	`\xhookleftarrow{abc}`	$\xleftrightharpoons{abc}$	`\xleftrightharpoons{abc}`
$\xhookrightarrow{abc}$	`\xhookrightarrow{abc}`	$\xmapsto{abc}$	`\xmapsto{abc}`
$\xLeftarrow{abc}$	`\xLeftarrow{abc}`	$\xRightarrow{abc}$	`\xRightarrow{abc}`
$\xleftharpoondown{abc}$	`\xleftharpoondown{abc}`	$\xrightharpoondown{abc}$	`\xrightharpoondown{abc}`
$\xleftharpoonup{abc}$	`\xleftharpoonup{abc}`	$\xrightharpoonup{abc}$	`\xrightharpoonup{abc}`
$\xleftrightarrow{abc}$	`\xleftrightarrow{abc}`	$\xrightleftharpoons{abc}$	`\xrightleftharpoons{abc}`
$\xLeftrightarrow{abc}$	`\xLeftrightarrow{abc}`		

Table 182: chemarr Extensible Arrows

$\xrightleftharpoons{abc}$	`\xrightleftharpoons{abc}`

Table 183: chemarrow Extensible Arrows

$\xleftarrow[def]{abc}$	`\autoleftarrow{abc}{def}`	$\xrightarrow[def]{abc}$	`\autorightarrow{abc}{def}`
$\xleftrightharpoons[def]{abc}$	`\autoleftrightharpoons{abc}{def}`	$\xrightleftharpoons[def]{abc}$	`\autorightleftharpoons{abc}{def}`

In addition to the symbols shown above, chemarrow also provides `\larrowfill`, `\rarrowfill`, `\leftrightharpoonsfill`, and `\rightleftharpoonsfill` macros. Each of these takes a length argument and produces an arrow of the specified length.

Table 184: extarrows Extensible Arrows

$\xLeftrightarrow{abc}$	`\xLeftrightarrow{abc}`	$\xLongleftrightarrow{abc}$	`\xLongleftrightarrow{abc}`
$\xleftrightarrow{abc}$	`\xleftrightarrow{abc}`	$\xlongleftrightarrow{abc}$	`\xlongleftrightarrow{abc}`
$\xlongequal{abc}$	`\xlongequal{abc}`	$\xLongrightarrow{abc}$	`\xLongrightarrow{abc}`
$\xLongleftarrow{abc}$	`\xLongleftarrow{abc}`	$\xlongrightarrow{abc}$	`\xlongrightarrow{abc}`
$\xlongleftarrow{abc}$	`\xlongleftarrow{abc}`		

Table 185: extpfeil Extensible Arrows

$\xlongequal{abc}$	`\xlongequal{abc}`	$\xmapsto{abc}$	`\xmapsto{abc}`
$\xtwoheadleftarrow{abc}$	`\xtwoheadleftarrow{abc}`	$\xtwoheadrightarrow{abc}$	`\xtwoheadrightarrow{abc}`

The extpfeil package also provides a `\newextarrow` command to help you define your own extensible arrow symbols. See the extpfeil documentation for more information.

Table 186: DotArrow Extensible Arrows

$\dotarrow{a}$	`\dotarrow{a}`

The DotArrow package provides mechanisms for lengthening the arrow, adjusting the distance between the arrow and its symbol, and altering the arrowhead. See the DotArrow documentation for more information.

Table 187: trfsigns Extensible Transform Symbols

$\dft{a}$	`\dft{a}`	$\DFT{a}$	`\DFT{a}`

Table 188: holtpolt Non-commutative Division Symbols

$\holter{abc}{def}$	`\holter{abc}{def}`	$\polter{abc}{def}$	`\polter{abc}{def}`

Table 189: Dots

$\cdotp$	`\cdotp`	:	`\colon`*	.	`\ldotp`	$\vdots$	`\vdots`†
$\cdots$	`\cdots`	$\ddots$	`\ddots`†	$\ldots$	`\ldots`		

* While ":" is valid in math mode, `\colon` uses different surrounding spacing. See Section 8.4 and the Short Math Guide for LaTeX [Dow00] for more information on math-mode spacing.

† The mathdots package redefines `\ddots` and `\vdots` to make them scale properly with font size. (They normally scale horizontally but not vertically.) `\fixedddots` and `\fixedvdots` provide the original, fixed-height functionality of LaTeX 2_ε's `\ddots` and `\vdots` macros.

Table 190: $\mathcal{AMS}$ Dots

⋱	\because*	⋯	\dotsi	∴	\therefore*
⋯	\dotsb	⋯	\dotsm		
…	\dotsc	…	\dotso		

* \because and \therefore are defined as binary relations and therefore also appear in Table 68 on page 30.

The $\mathcal{AMS}$ \dots_ symbols are named according to their intended usage: \dotsb between pairs of binary operators/relations, \dotsc between pairs of commas, \dotsi between pairs of integrals, \dotsm between pairs of multiplication signs, and \dotso between other symbol pairs.

Table 191: wasysym Dots

∴	\wasytherefore

Table 192: MnSymbol Dots

⋅	\cdot	⋰	\hdotdot	⋰	\udots
⋱	\ddotdot	⋯	\hdots	∴	\uptherefore
⋱	\ddots	⋰	\leftthere fore	⋮	\vdotdot
⋱	\diamonddots	⋱	\rightthere fore	⋮	\vdots
⋱	\downthere fore	⋮	\squaredots		
⋱	\fivedots	⋰	\udotdot		

MnSymbol defines \therefore as \uptherefore and \because as \downtherefore. Furthermore, \cdotp and \colon produce the same glyphs as \cdot and \vdotdot respectively but serve as TEX math punctuation (class 6 symbols) instead of TEX binary operators (class 2).

All of the above except \hdots and \vdots are defined as binary operators and therefore also appear in Table 50 on page 23. Also, unlike most of the other dot symbols in this document, MnSymbol's dots are defined as single characters instead of as composites of multiple single-dot characters.

Table 193: mathdots Dots

\	`\backslash`	∅	`\emptyset`‡	∇	`\nabla`	♠	`\spadesuit`
□	`\Box`*,†	♭	`\flat`	♮	`\natural`	√	`\surd`
♣	`\clubsuit`	♡	`\heartsuit`	¬	`\neg`	△	`\triangle`

* Not predefined in LaTeX 2_ε. Use one of the packages latexsym, amsfonts, amssymb, txfonts, pxfonts, or wasysym. Note, however, that amsfonts and amssymb define `\Diamond` to produce the same glyph as `\lozenge` ("◊"); the other packages produce a squarer `\Diamond` as depicted above.

† To use `\Box`—or any other symbol—as an end-of-proof (Q.E.D.) marker, consider using the ntheorem package, which properly juxtaposes a symbol with the end of the proof text.

‡ Many people prefer the look of $\mathcal{AMS}$'s `\varnothing` ("∅", Table 202) to that of LaTeX's `\emptyset`.

TABLE 202: Miscellaneous $\mathcal{AMS}$ Math Symbols

* Put "`\DeclareMathAlphabet{\mathpzc}{OT1}{pzc}{m}{it}`" in your document's preamble to make `\mathpzc` typeset its argument in Zapf Chancery. As a similar trick, you can typeset the Calligra font's script "$\mathscr{e}$" (or other calligraphic symbols) in math mode by loading the calligra package and putting "`\DeclareMathAlphabet{\mathcalligra}{T1}{calligra}{m}{n}`" in your document's preamble to make `\mathcalligra` typeset its argument in the Calligra font. (You may also want to specify "`\DeclareFontShape{T1}{calligra}{m}{n}{<->s*[2.2]callig15}{}`" to set Calligra at 2.2 times its design size for a better blend with typical body fonts.)

† The mathbbol package defines some additional blackboard bold characters: parentheses, square brackets, angle brackets, and—if the bbgreekl option is passed to mathbbol—Greek letters. For instance, "$\mathbb{\Langle\Lbrack\Lparen\bbalpha\bbbeta\bbgamma\Rparen\Rbrack\Rangle}$" is produced by "`\mathbb{\Langle\Lbrack\Lparen\bbalpha\bbbeta\bbgamma\Rparen\Rbrack\Rangle}`".

mbboard extends the blackboard bold symbol set significantly further. It supports not only the Greek alphabet—including "Greek-like" symbols such as `\bbnabla` ("$\mathbb{\nabla}$")—but also *all* punctuation marks, various currency symbols such as `\bbdollar` ("$\mathbb{\$}$") and `\bbeuro` ("$\mathbb{€}$"), and the Hebrew alphabet (e.g., "`\bbfinalnun\bbyod\bbqof\bbpe`" → "$\mathbb{\finalnun\yod\qof\pe}$").

‡ The `\sym...` commands provided by the LaTeX2e package are actually text-mode commands. They are included in Table 213 because they resemble the blackboard-bold symbols that appear in the rest of the table. In addition to the 26 letters of the English alphabet, LaTeX2e provides three umlauted blackboard-bold letters: `\symAE` ("$\mathbb{Ä}$"), `\symOE` ("$\mathbb{Ö}$"), and `\symUE` ("$\mathbb{Ü}$"). Note that LaTeX2e does provide math-mode commands for the most common number-set symbols. These are presented in Table 130 on page 49.

¶ As their `\text...` names imply, the fonts provided by the yfonts package are actually text fonts. They are included in Table 213 because they are frequently used in a mathematical context.

§ An older (i.e., prior to 1991) version of the $\mathcal{AMS}$'s fonts rendered $\mathbb{C}$, $\mathbb{N}$, $\mathbb{R}$, $\mathbb{S}$, and $\mathbb{Z}$ as $\mathbb{C}$, $\mathbb{N}$, $\mathbb{R}$, $\mathbb{S}$, and $\mathbb{Z}$. As some people prefer the older glyphs—much to the $\mathcal{AMS}$'s surprise—and because those glyphs fail to build under modern versions of METAFONT, Berthold Horn uploaded PostScript fonts for the older blackboard-bold glyphs to CTAN, to the `fonts/msym10` directory. As of this writing, however, there are no LaTeX 2_ε packages for utilizing the now-obsolete glyphs.

4 Science and technology symbols

This section lists symbols that are employed in various branches of science and engineering.

TABLE 214: gensymb Symbols Defined to Work in Both Math and Text Mode

℃	`\celsius`	µ	`\micro`	‰	`\perthousand`
°	`\degree`	Ω	`\ohm`		

TABLE 215: wasysym Electrical and Physical Symbols

∼	`\AC`	≋	`\VHF`	∼∼∼	`\photon`	F	`\HF`		`\gluon`

TABLE 216: ifsym Pulse Diagram Symbols

⌝	`\FallingEdge`	⌝⌟	`\LongPulseLow`	⌝⌜	`\PulseLow`	⌟⌞	`\ShortPulseHigh`
⌟⌜⌞	`\LongPulseHigh`	⌟⌞	`\PulseHigh`	⌟	`\RaisingEdge`	⌜	`\ShortPulseLow`

In addition, within `\textifsym{...}`, the following codes are valid:

_	l	¯	m	‾	h	‗	d	〈	<	〉	>
__	L	—	M	‾‾	H	‗‗	D	〈	<<	〉	>>

This enables one to write "`\textifsym{mm<DDD>mm}`" to get "⟵⬭⟶" or "`\textifsym{L|H|L|H|L}`" to get "⎽⎍⎽⎍⎽". See also the timing package, which provides a wide variety of pulse-diagram symbols within an environment designed specifically for typesetting pulse diagrams.

Finally, `\textifsym` supports the display of segmented digits, as would appear on an LCD: "`\textifsym{-123.456}`" produces "- 123.456". "`\textifsym{b}`" outputs a blank with the same width as an "8".

TABLE 217: ar Aspect Ratio Symbol

Æ	`\AR`

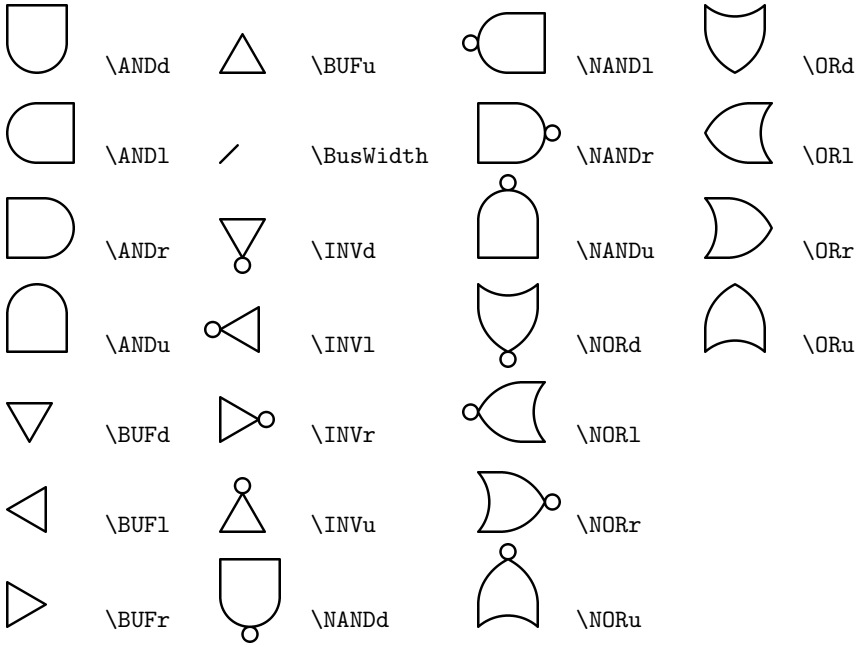
♣	\ENQ	♀	\FF	‼	\DCc	→	\SUB		
♠	\ACK	♪	\CR	¶	\DCd	←	\ESC		
•	\BEL	♫	\SO	§	\NAK	└	\FS		
⌂	\DEL		\NBSP		\NUL	¦	\splitvert		

Code Page 437 (CP437), which was first utilized by the original IBM PC, uses the symbols \SOH through \US to depict ASCII characters 1–31 and \DEL to depict ASCII character 127. The \NUL symbol, not part of CP437, represents ASCII character 0. \NBSP, also not part of CP437, represents a nonbreaking space. \splitvert is merely the "|" character drawn as it was on the IBM PC.

Table 228: milstd Logic Gates



The milstd package, which provides the digital logic-gate symbols specified by the U.S. Department of Defense's MIL-STD-806 standard, was written as a LaTeX 2.09 `.tex` file, not as a LaTeX 2_ε package. Consequently, it must be loaded into a document with `\input milstd`, not with the more modern `\usepackage{milstd}`.

Table 229: marvosym Communication Symbols

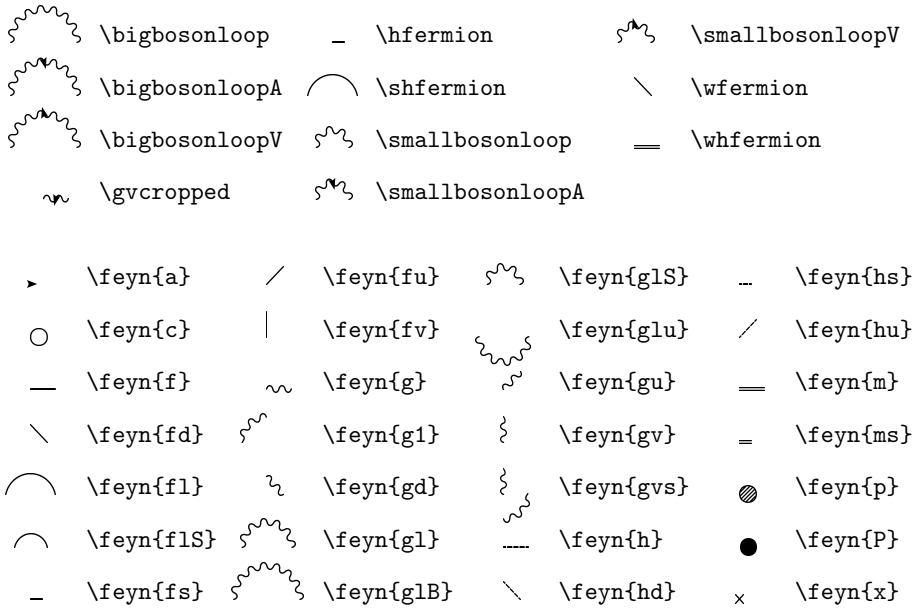
Table 234: feyn Feynman Diagram Symbols



All other arguments to the \feyn command produce a "▯" symbol.

The feyn package provides various commands for composing the preceding symbols into complete Feynman diagrams. See the feyn documentation for examples and additional information.

5 Dingbats

Dingbats are symbols such as stars, arrows, and geometric shapes. They are commonly used as bullets in itemized lists or, more generally, as a means to draw attention to the text that follows.

The pifont dingbat package warrants special mention. Among other capabilities, pifont provides a LaTeX interface to the Zapf Dingbats font (one of the standard 35 PostScript fonts). However, rather than name each of the dingbats individually, pifont merely provides a single `\ding` command, which outputs the character that lies at a given position in the font. The consequence is that the pifont symbols can't be listed by name in this document's index, so be mindful of that fact when searching for a particular symbol.

6 Ancient languages

This section presents letters and ideograms from various ancient scripts. Some of these symbols may also be useful in other typesetting contexts.

TABLE 269: phaistos Symbols from the Phaistos Disk

	\PHarrow		\PHeagle		\PHplumedHead
	\PHbee		\PHflute		\PHram
	\PHbeehive		\PHgaunlet		\PHrosette
	\PHboomerang		\PHgrater		\PHsaw
	\PHbow		\PHhelmet		\PHshield
	\PHbullLeg		\PHhide		\PHship
	\PHcaptive		\PHhorn		\PHsling
	\PHcarpentryPlane		\PHlid		\PHsmallAxe
	\PHcat		\PHlily		\PHstrainer
	\PHchild		\PHmanacles		\PHtattooedHead
	\PHclub		\PHmattock		\PHtiara
	\PHcolumn		\PHoxBack		\PHtunny
	\PHcomb		\PHpapyrus		\PHvine
	\PHdolium		\PHpedestrian		\PHwavyBand
	\PHdove		\PHplaneTree		\PHwoman

TABLE 270: protosem Proto-Semitic Characters

𐤀	\Aaleph	𐤄	\AAhe	𐤊	\Akaph	𐤎	\Asamekh	𐤓	\AAresh
𐤁	\AAaleph	𐤆	\Azayin	𐤋	\AAkaph	𐤐	\Ape	𐤔	\Ashin
𐤂	\Abeth	𐤅	\Avav	𐤌	\Alamed	𐤑	\AApe	𐤕	\Ahelmet
𐤃	\AAbeth	𐤇	\Aheth	𐤍	\AAlamed	𐤒	\Asade	𐤖	\AAhelmet
𐤄	\Agimel	𐤈	\AAheth	𐤎	\Amem	𐤓	\AAsade	𐤗	\Atav
𐤅	\Adaleth	𐤉	\Ateth	𐤏	\Anun	𐤔	\Aqoph		
𐤆	\AAdaleth	𐤊	\Ayod	𐤐	\Aayin	𐤕	\AAqoph		
𐤇	\Ahe	𐤋	\AAyod	𐤑	\AAayin	𐤖	\Aresh		

The protosem package defines abbreviated control sequences for each of the above. In addition, single-letter shortcuts can be used within the argument to the \textproto command (e.g., "\textproto{Pakyn}" produces "𐤑𐤀𐤊𐤉𐤏"). See the protosem documentation for more information.

Table 271: hieroglf Hieroglyphics

	\HA		\HI		\Hn		\HT
	\Ha		\Hi		\HO		\Ht
	\HB		\Hibl		\Ho		\Htongue
	\Hb		\Hibp		\Hp		\HU
	\Hc		\Hibs		\HP		\Hu
	\HC		\Hibw		\Hplural		\HV
	\HD		\HJ		\Hplus		\Hv
	\Hd		\Hj		\HQ		\Hvbar
	\Hdual		\Hk		\Hq		\Hw
	\He		\HK		\Hquery		\HW
	\HE		\HL		\HR		\HX
	\Hf		\Hl		\Hr		\Hx
	\HF		\Hm		\Hs		\HY
	\HG		\HM		\HS		\Hy
	\Hg		\Hman		\Hscribe		\Hz
	\Hh		\Hms		\Hslash		\HZ
	\HH		\HN		\Hsv		
	\Hone		\Hhundred		\HXthousand		\Hmillion
	\Hten		\Hthousand		\HCthousand		

The hieroglf package defines alternate control sequences and single-letter shortcuts for each of the above which can be used within the argument to the `\textpmhg` command (e.g., "`\textpmhg{Pakin}`" produces ""). See the hieroglf documentation for more information.

Table 272: linearA Linear A Script

Table 273: linearb Linear B Basic and Optional Letters

	\Ba		\Bja		\Bmu		\Bpte		\Broii		\Bto
	\Baii		\Bje		\Bna		\Bpu		\Bru		\Btu
	\Baiii		\Bjo		\Bne		\Bpuii		\Bsa		\Btwo
	\Bau		\Bju		\Bni		\Bqa		\Bse		\Bu
	\Bda		\Bka		\Bno		\Bqe		\Bsi		\Bwa
	\Bde		\Bke		\Bnu		\Bqi		\Bso		\Bwe
	\Bdi		\Bki		\Bnwa		\Bqo		\Bsu		\Bwi
	\Bdo		\Bko		\Bo		\Bra		\Bswa		\Bwo
	\Bdu		\Bku		\Bpa		\Braii		\Bswi		\Bza
	\Bdwe		\Bma		\Bpaiii		\Braiii		\Bta		\Bze
	\Bdwo		\Bme		\Bpe		\Bre		\Btaii		\Bzo
	\Be		\Bmi		\Bpi		\Bri		\Bte		
	\Bi		\Bmo		\Bpo		\Bro		\Bti		

These symbols must appear either within the argument to `\textlinb` or following the `\linbfamily` font-selection command within a scope. Single-character shortcuts are also supported: Both "`\textlinb{\Bpa\Bki\Bna}`" and "`\textlinb{pcn}`" produce "", for example. See the linearb documentation for more information.

Table 274: linearb Linear B Numerals

	\BNi		\BNvii		\BNxl		\BNc		\BNdcc
	\BNii		\BNviii		\BNl		\BNcc		\BNdccc
	\BNiii		\BNix		\BNlx		\BNccc		\BNcm
	\BNiv		\BNx		\BNlxx		\BNcd		\BNm
	\BNv		\BNxx		\BNlxxx		\BNd		
	\BNvi		\BNxxx		\BNxc		\BNdc		

These symbols must appear either within the argument to `\textlinb` or following the `\linbfamily` font-selection command within a scope.

Table 275: linearb Linear B Weights and Measures

	\BPtalent		\BPvolb		\BPvolcf		\BPwtb		\BPwtd
	\BPvola		\BPvolcd		\BPwta		\BPwtc		

These symbols must appear either within the argument to `\textlinb` or following the `\linbfamily` font-selection command within a scope.

TABLE 276: linearb Linear B Ideograms

	\BPamphora		\BPchassis		\BPman		\BPwheat
	\BParrow		\BPcloth		\BPnanny		\BPwheel
	\BPbarley		\BPcow		\BPolive		\BPwine
	\BPbilly		\BPcup		\BPox		\BPwineiih
	\BPboar		\BPewe		\BPpig		\BPwineiiih
	\BPbronze		\BPfoal		\BPram		\BPwineivh
	\BPbull		\BPgoat		\BPsheep		\BPwoman
	\BPcauldroni		\BPgoblet		\BPsow		\BPwool
	\BPcauldronii		\BPgold		\BPspear		
	\BPchariot		\BPhorse		\BPsword		

These symbols must appear either within the argument to `\textlinb` or following the `\linbfamily` font-selection command within a scope.

TABLE 277: linearb Unidentified Linear B Symbols

	\BUi		\BUiv		\BUvii		\BUx		\Btwe
	\BUii		\BUv		\BUviii		\BUxi		
	\BUiii		\BUvi		\BUix		\BUxii		

These symbols must appear either within the argument to `\textlinb` or following the `\linbfamily` font-selection command within a scope.

TABLE 278: cypriot Cypriot Letters

	\Ca		\Cku		\Cmu		\Cpo		\Cso		\Cwi
	\Ce		\Cla		\Cna		\Cpu		\Csu		\Cwo
	\Cga		\Cle		\Cne		\Cra		\Cta		\Cxa
	\Ci		\Cli		\Cni		\Cre		\Cte		\Cxe
	\Cja		\Clo		\Cno		\Cri		\Cti		\Cya
	\Cjo		\Clu		\Cnu		\Cro		\Cto		\Cyo
	\Cka		\Cma		\Co		\Cru		\Ctu		\Cza
	\Cke		\Cme		\Cpa		\Csa		\Cu		\Czo
	\Cki		\Cmi		\Cpe		\Cse		\Cwa		
	\Cko		\Cmo		\Cpi		\Csi		\Cwe		

These symbols must appear either within the argument to `\textcypr` or following the `\cyprfamily` font-selection command within a scope. Single-character shortcuts are also supported: Both "`\textcypr{\Cpa\Cki\Cna}`" and "`\textcypr{pcn}`" produce "", for example. See the cypriot documentation for more information.

TABLE 279: sarabian South Arabian Letters

𐩠	\SAa	𐩷	\SAz	𐩣	\SAm	𐩹	\SAsd	𐩢	\SAdb
𐩫	\SAb	𐩤	\SAhd	𐩥	\SAn	𐩺	\SAq	𐩸	\SAtb
𐩬	\SAg	𐩻	\SAtd	𐩦	\SAs	𐩧	\SAr	𐩮	\SAga
𐩵	\SAd	𐩰	\SAy	𐩼	\SAf	𐩴	\SAsv	𐩶	\SAzd
𐩲	\SAh	𐩴	\SAk	𐩨	\SAlq	𐩱	\SAt	𐩽	\SAsa
𐩪	\SAw	𐩬	\SAl	𐩨	\SAo	𐩲	\SAhu	𐩡	\SAdd

These symbols must appear either within the argument to `\textsarab` or following the `\sarabfamily` font-selection command within a scope. Single-character shortcuts are also supported: Both "`\textsarab{\SAb\SAk\SAn}`" and "`\textsarab{bkn}`" produce "𐩫𐩴𐩥", for example. See the sarabian documentation for more information.

TABLE 280: teubner Archaic Greek Letters and Greek Numerals

Ϙ	\Coppa†	Ϝ	\Digamma*	ϡ	\sampi*	ϛ	\varstigma
ϙ	\coppa†	͵	\koppa*	Ϛ	\Stigma		
ϝ	\digamma*,‡	Ͱ	\Sampi	ϛ	\stigma*		

* Technically, these symbols do not require teubner; it is sufficient to load the babel package with the greek option (upon which teubner depends)—but use `\qoppa` for `\koppa` and `\ddigamma` for `\digamma`.

† For compatibility with other naming conventions teubner defines `\Koppa` as a synonym for `\Coppa` and `\varcoppa` as a synonym for `\coppa`.

‡ If both teubner and amssymb are loaded, teubner's `\digamma` replaces amssymb's `\digamma`, regardless of package-loading order.

7 Other symbols

The following are all the symbols that didn't fit neatly or unambiguously into any of the previous sections. (Do weather symbols belong under "Science and technology"? Should dice be considered "mathematics"?) While some of the tables contain clearly related groups of symbols (e.g., musical notes), others represent motley assortments of whatever the font designer felt like drawing.

Table 281: textcomp Genealogical Symbols

TABLE 286: harmony Musical Symbols

	\AAcht		\DDohne		\Halb		\SechBR	>	\VM
	\Acht		\Dohne		\HaPa		\SechBr		\Zwdr
	\AchtBL		\Ds	.	\Pu		\SePa		\ZwPa
	\AchtBR		\DS		\Sech	<	\UB		
	\AcPa		\Ganz		\SechBL		\Vier		
	\DD		\GaPa		\SechBl		\ViPa		

The musixtex package must be installed to use harmony.

TABLE 287: harmony Musical Accents

Âa	\Ferli{A}\Ferli{a}*	Âa	\Ohne{A}\Ohne{a}*
Âa	\Fermi{A}\Fermi{a}	A a	\Umd{A}\Umd{a}*
(A)(a)	\Kr{A}\Kr{a}		

* These symbols take an optional argument which shifts the accent either horizontally or vertically (depending on the command) by the given distance.

In addition to the accents shown above, \HH is a special accent command which accepts five period-separated characters and typesets them such that "\HH.X.a.b.c.d." produces "X_{a}^{b}". All arguments except the first can be omitted: "\HH.X....." produces "X". \Takt takes two arguments and composes them into a musical time signature. For example, "\Takt{12}{8}" produces "$\frac{12}{8}$". As two special cases, "\Takt{c}{0}" produces "$\mathbf{C}$" and "\Takt{c}{1}" produces "$\mathbf{¢}$".

The musixtex package must be installed to use harmony.

TABLE 288: manfnt Dangerous Bend Symbols

\dbend \lhdbend \reversedvideodbend

Note that these symbols descend far beneath the baseline. manfnt also defines non-descending versions, which it calls, correspondingly, \textdbend, \textlhdbend, and \textreversedvideodbend.

TABLE 289: Miscellaneous manfnt Symbols

	\manboldkidney		\manpenkidney

Table 295: Miscellaneous universal Symbols

 \baudash  \bauforms  \bauquarter  \varQ

 \bauequal  \bauhead  \bauquestion

 \bauface  \bauplus \bauwindow

TABLE 296: Miscellaneous fourier Symbols

	\bomb		\grimace		\textthing*		\textxswup*
	\danger		\noway		\textxswdown*		

* fourier defines math-mode aliases for a few of the preceding symbols: \thething ("𝔗"), \xswordsup ("⤫"), and \xswordsdown ("⤬").

TABLE 297: ifsym Weather Symbols

	\Cloud		\Hail		\Sleet		\WeakRain
	\FilledCloud		\HalfSun		\Snow		\WeakRainCloud
	\FilledRainCloud		\Lightning		\SnowCloud		\FilledSnowCloud
	\FilledSunCloud		\NoSun		\Sun		
	\FilledWeakRainCloud		\Rain		\SunCloud		
	\Fog		\RainCloud		\ThinFog		

In addition, \Thermo{0}...\Thermo{6} produce thermometers that are between 0/6 and 6/6 full of mercury:

Similarly, \wind{⟨*sun*⟩}{⟨*angle*⟩}{⟨*strength*⟩} will draw wind symbols with a given amount of sun (0–4), a given angle (in degrees), and a given strength in km/h (0–100). For example, \wind{0}{0}{0} produces "", \wind{2}{0}{0} produces "", and \wind{4}{0}{100} produces "".

TABLE 298: ifsym Alpine Symbols

	\SummitSign		\Summit		\SurveySign		\HalfFilledHut
	\StoneMan		\Mountain		\Joch		\VarSummit
	\Hut		\IceMountain		\Flag		
	\FilledHut		\VarMountain		\VarFlag		
	\Village		\VarIceMountain		\Tent		

TABLE 299: ifsym Clocks

	\Interval		\StopWatchStart		\VarClock		\Wecker
	\StopWatchEnd		\Taschenuhr		\VarTaschenuhr		

ifsym also exports a \showclock macro. \showclock{⟨*hours*⟩}{⟨*minutes*⟩} outputs a clock displaying the corresponding time. For instance, "\showclock{5}{40}" produces "". ⟨*hours*⟩ must be an integer from 0 to 11, and ⟨*minutes*⟩ must be an integer multiple of 5 from 0 to 55.

TABLE 300: Other ifsym Symbols

❖	\FilledSectioningDiamond	✉	\Letter	☘	\Radiation
⏚	\Fire	▭	\PaperLandscape	❖	\SectioningDiamond
✕	\Irritant	▯	\PaperPortrait	☎	\Telephone

||	\StrokeTwo	||||	\StrokeFour		

TABLE 301: clock Clocks

\ClockStyle	\ClockFramefalse	\ClockFrametrue
0		
1		
2		
3		

The clock package provides a \clock command to typeset an arbitrary time on an analog clock (and \clocktime to typeset the document's build time). For example, the clocks in the above table were produced with \clock{15}{41}. Clock symbols are composed from a font of clock-face fragments using one of four values for \ClockStyle and either \ClockFrametrue or \ClockFrametrue as illustrated above. See the clock documentation for more information.

TABLE 302: epsdice Dice

⚀	\epsdice{1}	⚂	\epsdice{3}	⚄	\epsdice{5}
⚁	\epsdice{2}	⚃	\epsdice{4}	⚅	\epsdice{6}

Code Page 437 (CP437), which was first utilized by the original IBM PC, contains the set of box-drawing symbols (sides, corners, and intersections of single- and double-ruled boxes) shown above in character positions 176–223. These symbols also appear in the Unicode Box Drawing and Block Element tables.

The pmboxdraw package draws the CP437 box-drawing symbols using TEX rules (specifically, \vrule) instead of with a font and thereby provides the ability to alter both rule width and the separation between rules. See the pmboxdraw documentation for more information.

TABLE 316: staves Magical Staves

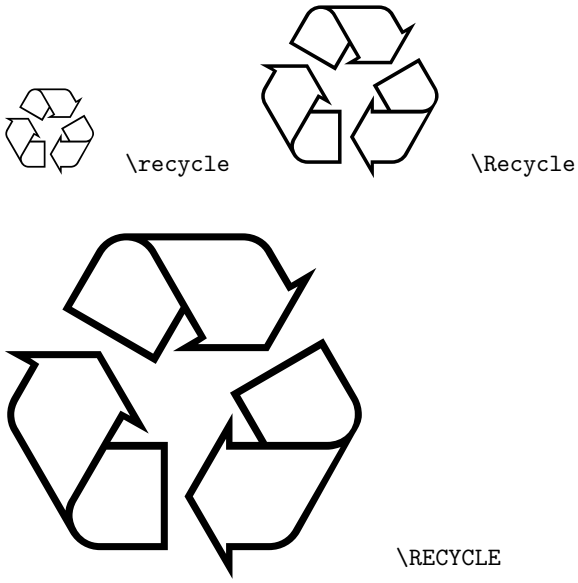
TABLE 320: recycle Recycling Symbols



The METAFONT code that implements the recycling symbols shown above is, in the words of its author, "awful code [that] doesn't even put the logo in a box (properly)". Expect to receive "`Inconsistent equation (off by` ⟨*number*⟩`)`" errors from METAFONT. Fortunately, if you tell METAFONT to proceed past those errors (e.g., by pressing Enter after each one or by specifying "`-interaction=nonstopmode`" on the METAFONT command line) it should produce a valid font.

The commands listed above should be used within a group (e.g., "`{\recycle}`") because they exhibit the side effect of *changing* the font to the recycle font.

8 Additional Information

Unlike the previous sections of this document, Section 8 does not contain new symbol tables. Rather, it provides additional help in using the Comprehensive LaTeX Symbol List. First, it draws attention to symbol names used by multiple packages. Next, it provides some guidelines for finding symbols and gives some examples regarding how to construct missing symbols out of existing ones. Then, it comments on the spacing surrounding symbols in math mode. After that, it presents an ASCII and Latin 1 quick-reference guide, showing how to enter all of the standard ASCII/Latin 1 symbols in LaTeX. And finally, it lists some statistics about this document itself.

8.1 Symbol Name Clashes

Unfortunately, a number of symbol names are not unique; they appear in more than one package. Depending on how the symbols are defined in each package, LaTeX will either output an error message or replace an earlier-defined symbol with a later-defined symbol. Table 321 on the following page presents a selection of name clashes that appear in this document.

Using multiple symbols with the same name in the same document—or even merely loading conflicting symbol packages—can be tricky but, as evidenced by the existence of Table 321, not impossible. The general procedure is to load the first package, rename the conflicting symbols, and then load the second package. Examine the LaTeX source for this document (`symbols.tex`) for examples of this and other techniques for handling symbol conflicts. Note that `symbols.tex`'s `\savesymbol` and `\restoresymbol` macros have been extracted into the savesym package, which can be downloaded from CTAN.

txfonts and pxfonts redefine a huge number of symbols—essentially, all of the symbols defined by latexsym, textcomp, the various $\mathcal{AMS}$ symbol sets, and LaTeX 2_ε itself. Similarly, mathabx redefines a vast number of math symbols in an attempt to improve their look. The txfonts, pxfonts, and mathabx conflicts are not listed in Table 321 because they are designed to be compatible with the symbols they replace. Table 322 on page 102 illustrates what "compatible" means in this context.

To use the new txfonts/pxfonts symbols without altering the document's main font, merely reset the default font families back to their original values after loading one of those packages:

```
\renewcommand\rmdefault{cmr}
\renewcommand\sfdefault{cmss}
\renewcommand\ttdefault{cmtt}
```

8.2 Resizing symbols

Mathematical symbols listed in this document as "variable-sized" are designed to stretch vertically. Each variable-sized symbol comes in one or more basic sizes plus a variation comprising both stretchable and nonstretchable segments. Table 323 on page 102 presents the symbols `\}` and `\uparrow` in their default size, in their `\big`, `\Big`, `\bigg`, and `\Bigg` sizes, in an even larger size achieved using `\left`/`\right`, and—for contrast—in a large size achieved by changing the font size using LaTeX 2_ε's `\fontsize` command. Because the symbols shown belong to the Computer Modern family, the type1cm package needs to be loaded to support font sizes larger than 24.88 pt.

Note how `\fontsize` makes the symbol wider and thicker. (The graphicx package's `\scalebox` or `\resizebox` commands would produce a similar effect.) Also, the `\fontsize`-enlarged symbol is vertically centered relative to correspondingly large text, unlike the symbols enlarged using `\big` et al. or `\left`/`\right`, which all use the same math axis regardless of symbol size. However, `\fontsize` is not limited to mathematical delimiters. Also, `\scalebox` and `\resizebox` are more robust to poorly composed symbols (e.g., two symbols made to overlap by backspacing a fixed distance) but do not work with every TeX backend and will produce jagged symbols when scaling a bitmapped font.

All variable-sized delimiters are defined (by the corresponding `.tfm` file) in terms of up to five segments, as illustrated by Figure 1 on page 102. The top, middle, and bottom segments are of a fixed size. The top-middle and middle-bottom segments (which are constrained to be the same character) are repeated as many times as necessary to achieve the desired height.

8.3 Where can I find the symbol for . . . ?

If you can't find some symbol you're looking for in this document, there are a few possible explanations:

TABLE 321: Symbol Name Clashes

Symbol	LaTeX 2ε	AMS	stmaryrd	wasysym	mathabx	marvosym	bbding	ifsym	dingbat	wsuipa
\baro			⌽							ɵ
\bigtriangledown	▽		▽

\TriangleUp							▲	△		

TABLE 322: Example of a Benign Name Clash

Symbol	Default (Computer Modern)	txfonts (Times Roman)
`R`	R	R
`\textrecipe`	℞	℞

TABLE 323: Sample resized delimiters

Symbol	Default size	`\big`	`\Big`	`\bigg`	`\Bigg`	`\left` / `\right`	`\fontsize`
`\}`	}	}	}	}	}	}	}
`\uparrow`	↑	↑	↑	↑	↑	↑	↑

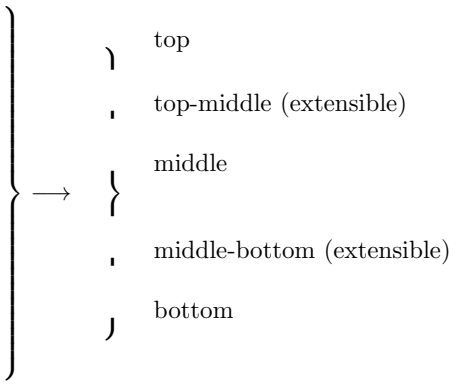

Figure 1: Implementation of variable-sized delimiters

- The symbol isn't intuitively named. As a few examples, the ifsym command to draw dice is "\Cube"; a plus sign with a circle around it ("exclusive or" to computer engineers) is "\oplus"; and lightning bolts in fonts designed by German speakers may have "blitz" in their names as in the ulsy package. The moral of the story is to be creative with synonyms when searching the index.
- The symbol is defined by some package that I overlooked (or deemed unimportant). If there's some symbol package that you think should be included in the Comprehensive LaTeX Symbol List, please send me e-mail at the address listed on the title page.
- The symbol isn't defined in any package whatsoever.

Even in the last case, all is not lost. Sometimes, a symbol exists in a font, but there is no LaTeX binding for it. For example, the PostScript Symbol font contains a "↵" symbol, which may be useful for representing a carriage return, but there is no package (as far as I know) for accessing that symbol. To produce an unnamed symbol, you need to switch to the font explicitly with LaTeX 2ε's low-level font commands [LaT00] and use TeX's primitive \char command [Knu86a] to request a specific character number in the font.[5] In fact, \char is not strictly necesssary; the character can often be entered symbolically. For example, the symbol for an impulse train or Tate-Shafarevich group ("Ш") is actually an uppercase *sha* in the Cyrillic alphabet. (Cyrillic is supported by the OT2 font encoding, for instance). While a *sha* can be defined numerically as "{\fontencoding{OT2}\selectfont\char88}" it may be more intuitive to use the OT2 font encoding's "SH" ligature: "{\fontencoding{OT2}\selectfont SH}".

Reflecting and rotating existing symbols

A common request on comp.text.tex is for a reversed or rotated version of an existing symbol. As a last resort, these effects can be achieved with the graphicx (or graphics) package's \reflectbox and \rotatebox macros. For example, \textsuperscript{\reflectbox{?}} produces an irony mark ("⸮"; cf. http://en.wikipedia.org/wiki/Irony_mark), and \rotatebox[origin=c]{180}{ι} produces the definite-description operator ("℩"). The disadvantage of the graphicx/graphics approach is that not every TeX backend handles graphical transformations.[6] Far better is to find a suitable font that contains the desired symbol in the correct orientation. For instance, if the phonetic package is available, then \textit{\riota} will yield a backend-independent "℩". Similarly, tipa's \textrevepsilon ("ɜ") or wsuipa's \revepsilon ("ɜ") may be used to express the mathematical notion of "such that" in a cleaner manner than with \reflectbox or \rotatebox.[7]

Joining and overlapping existing symbols

Symbols that do not exist in any font can sometimes be fabricated out of existing symbols. The LaTeX 2ε source file fontdef.dtx contains a number of such definitions. For example, \models (see Table 67 on page 30) is defined in that file with:

```
\def\models{\mathrel|\joinrel=}
```

where \mathrel and \joinrel are used to control the horizontal spacing. \def is the TeX primitive upon which LaTeX's \newcommand is based. See The TeXbook [Knu86a] for more information on all three of those commands.

With some simple pattern-matching, one can easily define a backward \models sign ("=|"):

```
\def\ismodeledby{=\joinrel\mathrel|}
```

In general, arrows/harpoons, horizontal lines ("=", "-", "\relbar", and "\Relbar"), and the various math-extension characters can be combined creatively with miscellaneous other characters to produce a variety of new symbols. Of course, new symbols can be composed from *any* set of existing characters. For instance, LaTeX defines \hbar ("ħ") as a "⁻" character (\mathchar'26) followed by a backspace of 9 math units (\mkern-9mu), followed by the letter "*h*":

```
\def\hbar{{\mathchar'26\mkern-9muh}}
```

[5] pifont defines a convenient \Pisymbol command for accessing symbols in PostScript fonts by number. For example, "\Pisymbol{psy}{191}" produces "↵".

[6] As an example, Xdvi ignores both \reflectbox and \rotatebox.

[7] More common symbols for representing "such that" include "|", ":", and "s.t.".

We can just as easily define other barred letters:

```
\def\bbar{{\mathchar'26\mkern-9mu b}}
\def\dbar{{\mathchar'26\mkern-12mu d}}
```

(The space after the "mu" is optional but is added for clarity.) `\bbar` and `\dbar` define "$\bar{b}$" and "$\bar{d}$", respectively. Note that `\dbar` requires a greater backward math kern than `\bbar`; a −9 mu kern would have produced the less-attractive "$\bar{d}$" glyph.

The amsmath package provides `\overset` and `\underset` commands for placing one symbol respectively above or below another. For example, `\overset{G}{\sim}`[8] produces "$\overset{G}{\sim}$" (sometimes used for "equidecomposable with respect to G").

Sometimes an ordinary `tabular` environment can be co-opted into juxtaposing existing symbols into a new symbol. Consider the following definition of `\asterism` ("⁂") from a June 2007 post to `comp.text.tex` by Peter Flynn:

```
\newcommand{\asterism}{\smash{%
   \raisebox{-.5ex}{%
     \setlength{\tabcolsep}{-.5pt}%
     \begin{tabular}{@{}cc@{}}%
       \multicolumn2c*\\[-2ex]*&*%
     \end{tabular}}}}
```

Note how the space between columns (`\tabcolsep`) and rows (`\\[...]`) is made negative to squeeze the asterisks closer together.

There is a TEX primitive called `\mathaccent` that centers one mathematical symbol atop another. For example, one can define `\dotcup` ("⊍")—the composition of a `\cup` and a `\cdot`—as follows:

```
\newcommand{\dotcup}{\ensuremath{\mathaccent\cdot\cup}}
```

The catch is that `\mathaccent` requires the accent to be a "math character". That is, it must be a character in a math font as opposed to a symbol defined in terms of other symbols. See The TEXbook [Knu86a] for more information.

Another TEX primitive that is useful for composing symbols is `\vcenter`. `\vcenter` is conceptually similar to "`\begin{tabular}{l}`" in LATEX but takes a list of vertical material instead of `\\`-separated rows. Also, it vertically centers the result on the math axis. (Many operators, such as "+" and "−" are also vertically centered on the math axis.) Enrico Gregorio posted the following symbol definition to `comp.text.tex` in March 2004 in response to a query about an alternate way to denote equivalence:

```
\newcommand*{\threesim}{%
  \mathrel{\vcenter{\offinterlineskip
  \hbox{$\sim$}\vskip-.35ex\hbox{$\sim$}\vskip-.35ex\hbox{$\sim$}}}}
```

The `\threesim` symbol, which vertically centers three `\sim` ("∼") symbols with 0.35 x-heights of space between them, is rendered as "≋". `\offinterlineskip` is a macro that disables implicit interline spacing. Without it, `\threesim` would have a full line of vertical spacing between each `\sim`. Because of `\vcenter`, `\threesim` aligns properly with other math operators: $a \div b \threesim c \times d$.

A related LATEX command, borrowed from Plain TEX, is `\ooalign`. `\ooalign` vertically overlaps symbols and works both within and outside of math mode. Essentially, it creates a single-column `tabular` environment with zero vertical distance between rows. However, because it is based directly on TEX's `\ialign` primitive, `\ooalign` uses TEX's tabular syntax instead of LATEX's (i.e., with `\cr` as the row terminator instead of `\\`). The following example of `\ooalign`, a macro that defines a standard-state symbol (`\stst`, "$^{\ominus}$") as a superscripted Plimsoll line (`\barcirc`, "$\ominus$"),[9] is due to an October 2007 `comp.text.tex` post by Donald Arseneau:

```
\makeatletter
\providecommand\barcirc{\mathpalette\@barred\circ}
\def\@barred#1#2{\ooalign{\hfil$#1-$\hfil\cr\hfil$#1#2$\hfil\cr}}
\newcommand\stst{^{\protect\barcirc}}
\makeatother
```

[8] LATEX's `\stackrel` command is similar but is limited to placing a symbol above a binary relation.

[9] While `\barcirc` illustrates how to combine symbols using `\ooalign`, the stmaryrd package's `\minuso` command (Table 46 on page 22) provides a similar glyph ("⊖") as a single, indivisible symbol.

In the preceding code, note the `\ooalign` call's use of `\hfil` to horizontally center a minus sign ("−") and a `\circ` ("∘").

As another example of `\ooalign`, consider the following code (due to Enrico Gregorio in a June 2007 post to `comp.text.tex`) that overlaps a `\ni` ("∋") and two minus signs ("−") to produce "∋", an obscure variation on the infrequently used "϶" symbol for "such that"discussed on page 103:

```
\newcommand{\suchthat}{%
  \mathrel{\ooalign{$\ni$\cr\kern-1pt$-$\kern-6.5pt$-$}}}
```

The slashed package, although originally designed for producing Feynman slashed-character notation, in fact facilitates the production of *arbitrary* overlapped symbols. The default behavior is to overwrite a given character with "/". For example, `\slashed{D}` produces "$\not{D}$". However, the `\declareslashed` command provides the flexibility to specify the mathematical context of the composite character (operator, relation, punctuation, etc., as will be discussed in Section 8.4), the overlapping symbol, horizontal and vertical adjustments in symbol-relative units, and the character to be overlapped. Consider, for example, the symbol for reduced quadrupole moment ("$\not{I}$"). This can be declared as follows:

```
\newcommand{\rqm}{{%
  \declareslashed{}{\text{-}}{0.04}{0}{I}\slashed{I}}}
```

`\declareslashed{·}{·}{·}{·}{I}` affects the meaning of all subsequent `\slashed{I}` commands in the same scope. The preceding definition of `\rqm` therefore uses an extra set of curly braces to limit that scope to a single `\slashed{I}`. In addition, `\rqm` uses amstext's `\text` macro (described on the next page) to make `\declareslashed` use a text-mode hyphen ("-") instead of a math-mode minus sign ("−") and to ensure that the hyphen scales properly in size in subscripts and superscripts. See slashed's documentation (located in `slashed.sty` itself) for a detailed usage description of the `\slashed` and `\declareslashed` commands.

Somewhat simpler than slashed is the centernot package. centernot provides a single command, `\centernot`, which, like `\not`, puts a slash over the subsequent mathematical symbol. However, instead of putting the slash at a fixed location, `\centernot` centers the slash over its argument. `\centernot` might be used, for example, to create a "does not imply" symbol:

$$\not\Longrightarrow \quad \texttt{\textbackslash not\textbackslash Longrightarrow}$$

vs.

$$\Longrightarrow\!\!\!\!\!\!/\;\; \quad \texttt{\textbackslash centernot\textbackslash Longrightarrow}$$

See the centernot documentation for more information.

Making new symbols work in superscripts and subscripts

To make composite symbols work properly within subscripts and superscripts, you may need to use TEX's `\mathchoice` primitive. `\mathchoice` evaluates one of four expressions, based on whether the current math style is display, text, script, or scriptscript. (See The TEXbook [Knu86a] for a more complete description.) For example, the following LATEX code—posted to `comp.text.tex` by Torsten Bronger—composes a sub/superscriptable "⊥" symbol out of `\top` and `\bot` ("⊤" and "⊥"):

```
\def\topbotatom#1{\hbox{\hbox to 0pt{$#1\bot$\hss}$#1\top$}}
\newcommand*{\topbot}{\mathrel{\mathchoice{\topbotatom\displaystyle}
                                  {\topbotatom\textstyle}
                                  {\topbotatom\scriptstyle}
                                  {\topbotatom\scriptscriptstyle}}}
```

The following is another example that uses `\mathchoice` to construct symbols in different math modes. The code defines a principal value integral symbol, which is an integral sign with a line through it.

```
\def\Xint#1{\mathchoice
   {\XXint\displaystyle\textstyle{#1}}%
   {\XXint\textstyle\scriptstyle{#1}}%
   {\XXint\scriptstyle\scriptscriptstyle{#1}}%
   {\XXint\scriptscriptstyle\scriptscriptstyle{#1}}%
```

```
   \!\int}
\def\XXint#1#2#3{{\setbox0=\hbox{$#1{#2#3}{\int}$}
     \vcenter{\hbox{$#2#3$}}\kern-.5\wd0}}
\def\ddashint{\Xint=}
\def\dashint{\Xint-}
```

(The preceding code was taken verbatim from the UK TEX Users' Group FAQ at `http://www.tex.ac.uk/faq`.) `\dashint` produces a single-dashed integral sign ("$⨍$"), while `\ddashint` produces a double-dashed one ("$⨎$"). The `\Xint` macro defined above can also be used to generate a wealth of new integrals: "$\oint\!\!\!\rightarrow$" (`\Xint\circlearrowright`), "$\oint\!\!\!\leftarrow$" (`\Xint\circlearrowleft`), "$\oint\!\!\!\subset$" (`\Xint\subset`), "$\oint\!\!\!\infty$" (`\Xint\infty`), and so forth.

LATEX 2_ε provides a simple wrapper for `\mathchoice` that sometimes helps produce terser symbol definitions. The macro is called `\mathpalette` and it takes two arguments. `\mathpalette` invokes the first argument, passing it one of "`\displaystyle`", "`\textstyle`", "`\scriptstyle`", or "`\scriptscriptstyle`", followed by the second argument. `\mathpalette` is useful when a symbol macro must know which math style is currently in use (e.g., to set it explicitly within an `\mbox`). Donald Arseneau posted the following `\mathpalette`-based definition of a probabilistic-independence symbol ("$\perp\!\!\!\perp$") to `comp.text.tex` in June 2000:

```
\newcommand\independent{\protect\mathpalette{\protect\independenT}{\perp}}
\def\independenT#1#2{\mathrel{\rlap{$#1#2$}\mkern2mu{#1#2}}}
```

The `\independent` macro uses `\mathpalette` to pass the `\independenT` helper macro both the current math style and the `\perp` symbol. `\independenT` typesets `\perp` in the current math style, moves two math units to the right, and finally typesets a second—overlapping—copy of `\perp`, again in the current math style. `\rlap`, which enables text overlap, is described later on this page.

Some people like their square-root signs with a trailing "hook" (i.e., "$\surd$") as this helps visually distinguish expressions like "$\sqrt{3x}$" from those like "$\sqrt{3}x$". In March 2002, Dan Luecking posted a `\mathpalette`-based definition of a hooked square-root symbol to `comp.text.tex`:

```
\def\hksqrt{\mathpalette\DHLhksqrt}
\def\DHLhksqrt#1#2{\setbox0=\hbox{$#1\sqrt{#2\,}$}\dimen0=\ht0
  \advance\dimen0-0.2\ht0
  \setbox2=\hbox{\vrule height\ht0 depth -\dimen0}%
  {\box0\lower0.4pt\box2}}
```

Notice how `\DHLhksqrt` uses `\mathpalette` to recover the outer math style (argument `#1`) from within an `\hbox`. The rest of the code is simply using TEX primitives to position a hook of height 0.2 times the `\sqrt` height at the right of the `\sqrt`. See The TEXbook [Knu86a] for more understanding of TEX "boxes" and "dimens".

Sometimes, however, amstext's `\text` macro is all that is necessary to make composite symbols appear correctly in subscripts and superscripts, as in the following definitions of `\neswarrow` ("$\swarrow\!\!\!\nearrow$") and `\nwsearrow` ("$\nwarrow\!\!\!\searrow$"):[10]

```
\newcommand{\neswarrow}{\mathrel{\text{$\nearrow$\llap{$\swarrow$}}}}
\newcommand{\nwsearrow}{\mathrel{\text{$\nwarrow$\llap{$\searrow$}}}}
```

`\text` resembles LATEX's `\mbox` command but shrinks its argument appropriately when used within a subscript or superscript. `\llap` ("left overlap") and its counterpart, `\rlap` ("right overlap"), appear frequently when creating composite characters. `\llap` outputs its argument to the left of the current position, overlapping whatever text is already there. Similarly, `\rlap` overlaps whatever text would normally appear to the right of its argument. For example, "`A\llap{B}`" and "`\rlap{A}B`" each produce "$\mathbb{B}$". However, the result of the former is the width of "A", and the result of the latter is the width of "B"—`\llap{...}` and `\rlap{...}` take up zero space.

In a June 2002 post to `comp.text.tex`, Donald Arseneau presented a general macro for aligning an arbitrary number of symbols on their horizontal centers and vertical baselines:

[10] Note that if your goal is to typeset commutative diagrams or pushout/pullback diagrams, then you should probably be using XY-pic.

```
\makeatletter
  \def\moverlay{\mathpalette\mov@rlay}
  \def\mov@rlay#1#2{\leavevmode\vtop{%
     \baselineskip\z@skip \lineskiplimit-\maxdimen
     \ialign{\hfil$#1##$\hfil\cr#2\crcr}}}
\makeatother
```

The `\makeatletter` and `\makeatother` commands are needed to coerce LaTeX into accepting "`@`" as part of a macro name. `\moverlay` takes a list of symbols separated by `\cr` (TeX's equivalent of LaTeX's `\\`). For example, the `\topbot` command defined on page 105 could have been expressed as "`\moverlay{\top\cr\bot}`" and the `\neswarrow` command defined on the previous page could have been expressed as "`\moverlay{\nearrow\cr\swarrow}`".

The basic concept behind `\moverlay`'s implementation is that `\moverlay` typesets the given symbols in a table that utilizes a zero `\baselineskip`. This causes every row to be typeset at the same vertical position. See The TeXbook [Knu86a] for explanations of the TeX primitives used by `\moverlay`.

Modifying LaTeX-generated symbols

Oftentimes, symbols composed in the LaTeX 2ε source code can be modified with minimal effort to produce useful variations. For example, `fontdef.dtx` composes the `\ddots` symbol (see Table 189 on page 63) out of three periods, raised 7 pt., 4 pt., and 1 pt., respectively:

```
\def\ddots{\mathinner{\mkern1mu\raise7\p@
    \vbox{\kern7\p@\hbox{.}}\mkern2mu
    \raise4\p@\hbox{.}\mkern2mu\raise\p@\hbox{.}\mkern1mu}}
```

`\p@` is a LaTeX 2ε shortcut for "`pt`" or "`1.0pt`". The remaining commands are defined in The TeXbook [Knu86a]. To draw a version of `\ddots` with the dots going along the opposite diagonal, we merely have to reorder the `\raise7\p@`, `\raise4\p@`, and `\raise\p@`:

```
\makeatletter
  \def\revddots{\mathinner{\mkern1mu\raise\p@
    \vbox{\kern7\p@\hbox{.}}\mkern2mu
    \raise4\p@\hbox{.}\mkern2mu\raise7\p@\hbox{.}\mkern1mu}}
\makeatother
```

`\revddots` is essentially identical to the mathdots package's `\iddots` command or the yhmath package's `\adots` command.

Producing complex accents

Accents are a special case of combining existing symbols to make new symbols. While various tables in this document show how to add an accent to an existing symbol, some applications, such as transliterations from non-Latin alphabets, require *multiple* accents per character. For instance, the creator of pdfTeX writes his name as "Hàn Thế́ Thành". The dblaccnt package enables LaTeX to stack accents, as in "`H\‘an Th\’{\^e} Th\‘anh`" (albeit not in the OT1 font encoding). In addition, the wsuipa package defines `\diatop` and `\diaunder` macros for putting one or more diacritics or accents above or below a given character. For example, `\diaunder[{\diatop[\’|\=]}|\textsubdot{r}]` produces "í̱". See the wsuipa documentation for more information.

The accents package facilitates the fabrication of accents in math mode. Its `\accentset` command enables *any* character to be used as an accent. For instance, `\accentset{\star}{f}` produces "$\overset{\star}{f}$" and `\accentset{e}{X}` produces "$\overset{e}{X}$". `\underaccent` does the same thing, but places the accent beneath the character. This enables constructs like `\underaccent{\tilde}{V}`, which produces "$\underset{\sim}{V}$". accents provides other accent-related features as well; see the documentation for more information.

Creating extensible symbols

A relatively simple example of creating extensible symbols stems from a `comp.text.tex` post by Donald Arseneau (June 2003). The following code defines an equals sign that extends as far to the right as possible, just like LaTeX's `\hrulefill` command:

```
\makeatletter
\def\equalsfill{$\m@th\mathord=\mkern-7mu
  \cleaders\hbox{$\!\mathord=\!$}\hfill
  \mkern-7mu\mathord=$}
\makeatother
```

TEX's `\cleaders` and `\hfill` primitives are the key to understanding `\equalsfill`'s extensibility. Essentially, `\equalsfill` repeats a box containing "=" plus some negative space until it fills the maximum available horizontal space. `\equalsfill` is intended to be used with LATEX's `\stackrel` command, which stacks one mathematical expression (slightly reduced in size) atop another. Hence, "`\stackrel{a}{\rightarrow}`" produces "$\stackrel{a}{\rightarrow}$" and "X `\stackrel{\text{definition}}{\hbox{\equalsfill}}` Y" produces "$X \stackrel{\text{definition}}{=\!=\!=\!=\!=\!=\!=} Y$".

If all that needs to extend are horizontal and vertical lines—as opposed to repeated symbols such as the "=" in the previous example—LATEX's `array` or `tabular` environments may suffice. Consider the following code (due to a February 1999 `comp.text.tex` post by Donald Arseneau and subsequent modifications by Billy Yu and Scott Pakin) for typesetting annuity and life-insurance symbols:

```
\DeclareRobustCommand{\actuarial}[2][]{%
  \def\arraystretch{0}%
  \setlength\arraycolsep{0.5pt}%
  \setlength\arrayrulewidth{0.5pt}%
  \setbox0=\hbox{$\scriptstyle#1#2$}%
  \begin{array}[b]{*2{@{}>{\scriptstyle}c}|}
    \cline{2-2}%
    \rule[1.25pt]{0pt}{\ht0}%
    #1 & #2%
  \end{array}%
}
```

Using the preceding definition, one can type, e.g., "`$a_{\actuarial{n}}$`" to produce "$a_{\overline{n}|}$" and "`$a_{\actuarial[x:]{n}}$`" to produce "$a_{x:\overline{n}|}$"

A more complex example of composing accents is the following definition of extensible `\overbracket`, `\underbracket`, `\overparenthesis`, and `\underparenthesis` symbols, taken from a May 2002 `comp.text.tex` post by Donald Arseneau:

```
\makeatletter
\def\overbracket#1{\mathop{\vbox{\ialign{##\crcr\noalign{\kern3\p@}
      \downbracketfill\crcr\noalign{\kern3\p@\nointerlineskip}
      $\hfil\displaystyle{#1}\hfil$\crcr}}}\limits}
\def\underbracket#1{\mathop{\vtop{\ialign{##\crcr
      $\hfil\displaystyle{#1}\hfil$\crcr\noalign{\kern3\p@\nointerlineskip}
      \upbracketfill\crcr\noalign{\kern3\p@}}}}\limits}
\def\overparenthesis#1{\mathop{\vbox{\ialign{##\crcr\noalign{\kern3\p@}
      \downparenthfill\crcr\noalign{\kern3\p@\nointerlineskip}
      $\hfil\displaystyle{#1}\hfil$\crcr}}}\limits}
\def\underparenthesis#1{\mathop{\vtop{\ialign{##\crcr
      $\hfil\displaystyle{#1}\hfil$\crcr\noalign{\kern3\p@\nointerlineskip}
      \upparenthfill\crcr\noalign{\kern3\p@}}}}\limits}
\def\downparenthfill{$\m@th\braceld\leaders\vrule\hfill\bracerd$}
\def\upparenthfill{$\m@th\bracelu\leaders\vrule\hfill\braceru$}
\def\upbracketfill{$\m@th\makesm@sh{\llap{\vrule\@height3\p@\@width.7\p@}}%
  \leaders\vrule\@height.7\p@\hfill
  \makesm@sh{\rlap{\vrule\@height3\p@\@width.7\p@}}$}
\def\downbracketfill{$\m@th
  \makesm@sh{\llap{\vrule\@height.7\p@\@depth2.3\p@\@width.7\p@}}%
  \leaders\vrule\@height.7\p@\hfill
  \makesm@sh{\rlap{\vrule\@height.7\p@\@depth2.3\p@\@width.7\p@}}$}
\makeatother
```

Table 324 showcases these accents. The TEXbook [Knu86a] or another book on TEX primitives is indispensible for understanding how the preceding code works. The basic idea is that `\downparenthfill`, `\upparenthfill`, `\downbracketfill`, and `\upbracketfill` do all of the work; they output a left symbol (e.g., `\braceld` [“⎩”] for `\downparenthfill`), a horizontal rule that stretches as wide as possible, and a right symbol (e.g., `\bracerd` [“⎭”] for `\downparenthfill`). `\overbracket`, `\underbracket`, `\overparenthesis`, and `\underparenthesis` merely create a table whose width is determined by the given text, thereby constraining the width of the horizontal rules.

TABLE 324: Manually Composed Extensible Accents

$\overbracket{abc}$	`\overbracket{abc}`	$\overparenthesis{abc}$	`\overparenthesis{abc}`
$\underbracket{abc}$	`\underbracket{abc}`	$\underparenthesis{abc}$	`\underparenthesis{abc}`

Note that the simplewick package provides mechanisms for typesetting Wick contractions, which utilize `\overbracket`- and `\underbracket`-like brackets of variable width *and* height (or depth). For example, “`\acontraction{}{A}{B}{C}\acontraction[2ex]{A}{B}{C}{D}\bcontraction{}{A}{BC}{D}ABCD`” produces

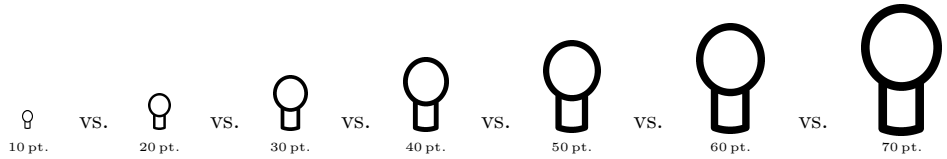
$$\acontraction{}{A}{B}{C}\acontraction[2ex]{A}{B}{C}{D}\bcontraction{}{A}{BC}{D}ABCD \quad .$$

See the simplewick documentation for more information.

Developing new symbols from scratch

Sometimes is it simply not possible to define a new symbol in terms of existing symbols. Fortunately, most, if not all, TEX distributions are shipped with a tool called METAFONT which is designed specifically for creating fonts to be used with TEX. The METAFONTbook [Knu86b] is the authoritative text on METAFONT. If you plan to design your own symbols with METAFONT, The METAFONTbook is essential reading. You may also want to read the freely available METAFONT primer located at `http://metafont.tutorial.free.fr/`. The following is an extremely brief tutorial on how to create a new LATEX symbol using METAFONT. Its primary purpose is to cover the LATEX-specific operations not mentioned in The METAFONTbook and to demonstrate that symbol-font creation is not necessarily a difficult task.

Suppose we need a symbol to represent a light bulb (“💡”).[11] The first step is to draw this in METAFONT. It is common to separate the font into two files: a size-dependent file, which specifies the design size and various font-specific parameters that are a function of the design size; and a size-independent file, which draws characters in the given size. Figure 2 shows the METAFONT code for `lightbulb10.mf`. `lightbulb10.mf` specifies various parameters that produce a 10 pt. light bulb then loads `lightbulb.mf`. Ideally, one should produce `lightbulb`⟨*size*⟩`.mf` files for a variety of ⟨*size*⟩s. This is called “optical scaling”. It enables, for example, the lines that make up the light bulb to retain the same thickness at different font sizes, which looks much nicer than the alternative—and default—“mechanical scaling”. When a `lightbulb`⟨*size*⟩`.mf` file does not exist for a given size ⟨*size*⟩, the computer mechanically produces a wider, taller, thicker symbol:



`lightbulb.mf`, shown in Figure 3, draws a light bulb using the parameters defined in `lightbulb10.mf`. Note that the the filenames “`lightbulb10.mf`” and “`lightbulb.mf`” do not follow the Berry font-naming scheme [Ber01]; the Berry font-naming scheme is largely irrelevant for symbol fonts, which generally lack bold, italic, small-caps, slanted, and other such variants.

The code in Figures Figure 2 and Figure 3 is heavily commented and should demonstrate some of the basic concepts behind METAFONT usage: declaring variables, defining points, drawing lines and curves, and preparing to debug or fine-tune the output. Again, The METAFONTbook [Knu86b] is the definitive reference on METAFONT programming.

[11] I'm not a very good artist; you'll have to pretend that “💡” looks like a light bulb.

```
font_identifier := "LightBulb10";                    % Name the font.
font_size 10pt#;                                     % Specify the design size.

em# := 10pt#;                                        % "M" width is 10 points.
cap# := 7pt#;                                        % Capital letter height is 7 points above the baseline.
sb# := 1/4pt#;                                       % Leave this much space on the side of each character.
o# := 1/16pt#;                                       % Amount that curves overshoot borders.

input lightbulb                                      % Load the file that draws the actual glyph.
```

Figure 2: Sample METAFONT size-specific file (`lightbulb10.mf`)

```
mode_setup;                                          % Target a given printer.

define_pixels(em, cap, sb);                          % Convert to device-specific units.
define_corrected_pixels(o);                          % Same, but add a device-specific fudge factor.

%% Define a light bulb at the character position for "A"
%% with width 1/2em#, height cap#, and depth 1pt#.
beginchar("A", 1/2em#, cap#, 1pt#); "A light bulb";
    pickup pencircle scaled 1/2pt;                   % Use a pen with a small, circular tip.

    %% Define the points we need.
    top z1 = (w/2, h + o);                           % z1 is at the top of a circle.
    rt z2 = (w + sb + o - x4, y4);                   % z2 is at the same height as z4 but the opposite side.
    bot z3 = (z1 - (0, w - sb - o));                 % z3 is at the bottom of the circle.
    lft z4 = (sb - o, 1/2[y1, y3]);                  % z4 is on the left of the circle.
    path bulb;                                       % Define a path for the bulb itself.
    bulb = z1 .. z2 .. z3 .. z4 .. cycle;            % The bulb is a closed path.

    z5 = point 2 - 1/3 of bulb;                      % z5 lies on the bulb, a little to the right of z3.
    z6 = (x5, 0);                                    % z6 is at the bottom, directly under z5.
    z7 = (x8, 0);                                    % z7 is at the bottom, directly under z8.
    z8 = point 2 + 1/3 of bulb;                      % z8 lies on the bulb, a little to the left of z3.
    bot z67 = (1/2[x6, x7], pen_bot - o - 1/8pt);    % z67 lies halfway between z6 and z7 but a jot lower.

    %% Draw the bulb and the base.
    draw bulb;                                       % Draw the bulb proper.
    draw z5 -- z6 .. z67 .. z7 -- z8;                % Draw the base of the bulb.

    %% Display key positions and points to help us debug.
    makegrid(0, sb, w/2, w - sb)(0, -1pt, y2, h);    % Label "interesting" x and y coordinates.
    penlabels(1, 2, 3, 4, 5, 6, 67, 7, 8);           % Label control points for debugging.
endchar;
end
```

Figure 3: Sample METAFONT size-independent file (`lightbulb.mf`)

METAFONT can produce "proofs" of fonts—large, labeled versions that showcase the logical structure of each character. In fact, proof mode is METAFONT's default mode. To produce a proof of `lightbulb10.mf`, issue the following commands at the operating-system prompt:

prompt> **mf lightbulb10.mf** ⇐ Produces `lightbulb10.2602gf`
prompt> **gftodvi lightbulb10.2602gf** ⇐ Produces `lightbulb10.dvi`

You can then view `lightbulb10.dvi` with any DVI viewer. The result is shown in Figure 4. Observe how the grid defined with *makegrid* at the bottom of Figure 3 draws vertical lines at positions 0, sb, $w/2$, and $w - sb$ and horizontal lines at positions 0, $-1pt$, y_2, and h. Similarly, observe how the *penlabels* command labels all of the important coordinates: $z_1, z_2, \ldots, z_8$ and z_{67}, which `lightbulb.mf` defines to lie between z_6 and z_7.

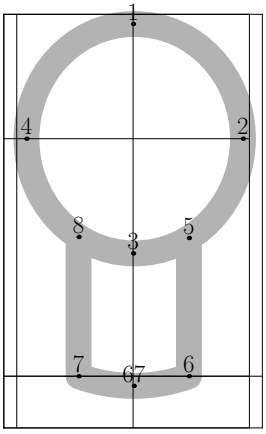


Figure 4: Proof diagram of `lightbulb10.mf`

Most, if not all, TEX distributions include a Plain TEX file called `testfont.tex` which is useful for testing new fonts in a variety of ways. One useful routine produces a table of all of the characters in the font:

```
prompt> tex testfont
This is TeX, Version 3.14159 (Web2C 7.3.1)
(/usr/share/texmf/tex/plain/base/testfont.tex
Name of the font to test = lightbulb10
Now type a test command (\help for help):)
*\table

*\bye
[1]
Output written on testfont.dvi (1 page, 1516 bytes).
Transcript written on testfont.log.
```

The resulting table, stored in `testfont.dvi` and illustrated in Figure 5, shows every character in the font. To understand how to read the table, note that the character code for "A"—the only character defined by `lightbulb10.mf`—is 41 in hexadecimal (base 16) and 101 in octal (base 8).

The LightBulb10 font is now usable by TEX. LATEX 2_ε, however, needs more information before documents can use the font. First, we create a font-description file that tells LATEX 2_ε how to map fonts in a given font family and encoding to a particular font in a particular font size. For symbol fonts, this mapping is fairly simple. Symbol fonts almost always use the "U" ("Unknown") font encoding and frequently occur in only one variant: normal weight and non-italicized. The filename for a font-description file important; it must be of the form "⟨*encoding*⟩⟨*family*⟩`.fd`", where ⟨*encoding*⟩ is the lowercase version of the encoding name (typically "u" for symbol fonts) and ⟨*family*⟩ is the name of the font family. For LightBulb10, let's call this "bulb". Figure 6 lists the contents of `ubulb.fd`. The document "LATEX 2_ε Font Selection" [LAT00] describes `\DeclareFontFamily` and `\DeclareFontShape` in detail, but the gist of `ubulb.fd` is first to declare a `U`-encoded version of the `bulb` font family and then to specify that a LATEX 2_ε request for a `U`-encoded version of `bulb` with a (`m`)edium font

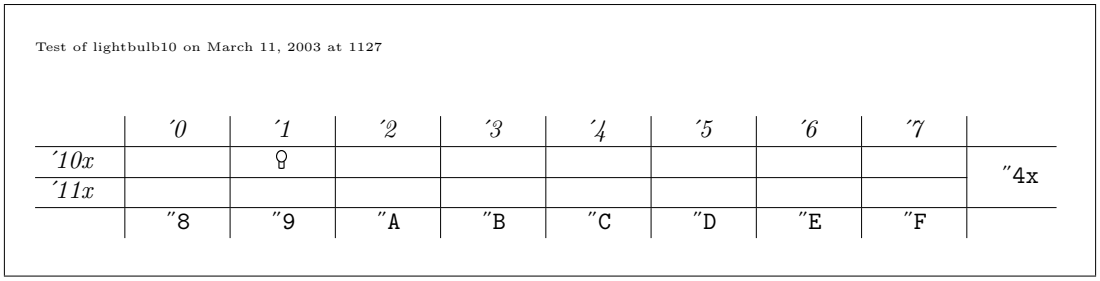

Figure 5: Font table produced by `testfont.tex`

```
\DeclareFontFamily{U}{bulb}{}
\DeclareFontShape{U}{bulb}{m}{n}{<-> lightbulb10}{}
```

Figure 6: LaTeX 2_ε font-description file (`ubulb.fd`)

series (as opposed to, e.g., bold) and a (`n`)ormal font shape (as opposed to, e.g., italic) should translate into a TeX request for `lightbulb10.tfm` mechanically scaled to the current font size.

The final step is to write a LaTeX 2_ε style file that defines a name for each symbol in the font. Because we have only one symbol our style file, `lightbulb.sty` (Figure 7), is rather trivial. Note that instead of typesetting "`A`" we could have had `\lightbulb` typeset "`\char65`", "`\char"41`", or "`\char'101`" (respectively, decimal, hexadecimal, and octal character offsets into the font). For a simple, one-character symbol font such as LightBulb10 it would be reasonable to merge `ubulb.fd` into `lightbulb.sty` instead of maintaining two separate files. In either case, a document need only include "`\usepackage{lightbulb}`" to make the `\lightbulb` symbol available.

```
\newcommand{\lightbulb}{{\usefont{U}{bulb}{m}{n}A}}
```

Figure 7: LaTeX 2_ε style file (`lightbulb.sty`)

METAFONT normally produces bitmapped fonts. However, it is also possible, with the help of some external tools, to produce PostScript Type 1 fonts. These have the advantages of rendering better in Adobe® Acrobat® (at least in versions prior to 6.0) and of being more memory-efficient when handled by a PostScript interpreter. See `http://www.tex.ac.uk/cgi-bin/texfaq2html?label=textrace` for pointers to tools that can produce Type 1 fonts from METAFONT.

8.4 Math-mode spacing

Terms such as "binary operators", "relations", and "punctuation" in Section 3 primarily regard the surrounding spacing. (See the Short Math Guide for LaTeX [Dow00] for a nice exposition on the subject.) To use a symbol for a different purpose, you can use the TeX commands `\mathord`, `\mathop`, `\mathbin`, `\mathrel`, `\mathopen`, `\mathclose`, and `\mathpunct`. For example, if you want to use `\downarrow` as a variable (an "ordinary" symbol) instead of a delimiter, you can write "`$3 x + \mathord{\downarrow}$`" to get the properly spaced "$3x + \downarrow$" rather than the awkward-looking "$3x+ \downarrow$". Similarly, to create a dotted-union symbol ("$\dot\cup$") that spaces like the ordinary set-union symbol (`\cup`) it must be defined with `\mathbin`, just as `\cup` is. Contrast "`$A \dot{\cup} B$`" ("$A \dot\cup B$") with "`$A \mathbin{\dot{\cup}} B$`" ("$A \dot\cup B$"). See The TeXbook [Knu86a] for the definitive description of math-mode spacing.

The purpose of the "log-like symbols" in Table 128 and Table 129 is to provide the correct amount of spacing around and within multiletter function names. Table 325 on the following page contrasts the output of the log-like symbols with various, naïve alternatives. In addition to spacing, the log-like symbols also handle subscripts properly. For example, "`\max_{p \in P}`" produces "$\max_{p \in P}$" in text, but "$\max\limits_{p \in P}$" as part of a displayed formula.

The amsmath package makes it straightforward to define new log-like symbols:

```
\DeclareMathOperator{\atan}{atan}
\DeclareMathOperator*{\lcm}{lcm}
```

Table 325: Spacing Around/Within Log-like Symbols

LaTeX expression	Output	
`$r \sin \theta$`	$r \sin \theta$	(best)
`$r sin \theta$`	$r sin \theta$	
`$r \mbox{sin} \theta$`	$r \mathrm{sin} \theta$	
`$r \mathrm{sin} \theta$`	$r \mathrm{sin} \theta$	

The difference between `\DeclareMathOperator` and `\DeclareMathOperator*` involves the handling of subscripts. With `\DeclareMathOperator*`, subscripts are written beneath log-like symbols in display style and to the right in text style. This is useful for limit operators (e.g., `\lim`) and functions that tend to map over a set (e.g., `\min`). In contrast, `\DeclareMathOperator` tells TeX that subscripts should always be displayed to the right of the operator, as is common for functions that take a single parameter (e.g., `\log` and `\cos`). Table 326 contrasts symbols declared with `\DeclareMathOperator` and `\DeclareMathOperator*` in both text style (`$...$`) and display style (`\[...\]`).[12]

Table 326: Defining new log-like symbols

Declaration function	`$\newlogsym_{p \in P}$`	`\[ \newlogsym_{p \in P} \]`
`\DeclareMathOperator`	$\mathrm{newlogsym}_{p \in P}$	$\mathrm{newlogsym}_{p \in P}$
`\DeclareMathOperator*`	$\mathrm{newlogsym}_{p \in P}$	$\mathrm{newlogsym}\limits_{p \in P}$

It is common to use a thin space (`\,`) between the words of a multiword operators, as in "`\DeclareMathOperator*{\argmax}{arg\,max}`". `\liminf`, `\limsup`, and all of the log-like symbols shown in Table 129 utilize this spacing convention.

8.5 Bold mathematical symbols

LaTeX does not normally use bold symbols when typesetting mathematics. However, bold symbols are occasionally needed, for example when naming vectors. Any of the approaches described at `http://www.tex.ac.uk/cgi-bin/texfaq2html?label=boldgreek` can be used to produce bold mathematical symbols. Table 327 contrasts the output produced by these various techniques. As the table illustrates, these techniques exhibit variation in their formatting of Latin letters (upright vs. italic), formatting of Greek letters (bold vs. normal), formatting of operators and relations (bold vs. normal), and spacing.

Table 327: Producing bold mathematical symbols

Package	Code	Output	
none	`$\alpha + b = \Gamma \div D$`	$\alpha + b = \Gamma \div D$	(no bold)
none	`$\mathbf{\alpha + b = \Gamma \div D}$`	$\mathbf{\alpha + b = \Gamma \div D}$	
none	`\boldmath$\alpha + b = \Gamma \div D$`	$\boldsymbol{\alpha + b = \Gamma \div D}$	
amsbsy	`$\pmb{\alpha + b = \Gamma \div D}$`	$\pmb{\alpha + b = \Gamma \div D}$	(faked bold)
amsbsy	`$\boldsymbol{\alpha + b = \Gamma \div D}$`	$\boldsymbol{\alpha + b = \Gamma \div D}$	
bm	`$\bm{\alpha + b = \Gamma \div D}$`	$\boldsymbol{\alpha + b = \Gamma \div D}$	
fixmath	`$\mathbold{\alpha + b = \Gamma \div D}$`	$\mathbold{\alpha + b = \Gamma \div D}$	

[12] Note that `\displaystyle` can be used to force display style within `$...$` and `\textstyle` can be used to force text style within `\[...\]`.

8.6 ASCII and Latin 1 quick reference

Table 328 amalgamates data from various other tables in this document into a convenient reference for LaTeX 2ε typesetting of ASCII characters, i.e., the characters available on a typical U.S. computer keyboard. The first two columns list the character's ASCII code in decimal and hexadecimal. The third column shows what the character looks like. The fourth column lists the LaTeX 2ε command to typeset the character as a text character. And the fourth column lists the LaTeX 2ε command to typeset the character within a `\texttt{...}` command (or, more generally, when `\ttfamily` is in effect).

TABLE 328: LaTeX 2ε ASCII Table

Dec	Hex	Char	Body text	\texttt
33	21	!	!	!
34	22	"	\textquotedbl	"
35	23	#	\#	\#
36	24	$	\$	\$
37	25	%	\%	\%
38	26	&	\&	\&
39	27	’	’	’
40	28	(	(	(
41	29	)	)	)
42	2A	*	*	*
43	2B	+	+	+
44	2C	,	,	,
45	2D	-	-	-
46	2E	.	.	.
47	2F	/	/	/
48	30	0	0	0
49	31	1	1	1
50	32	2	2	2
⋮	⋮	⋮	⋮	⋮
57	39	9	9	9
58	3A	:	:	:
59	3B	;	;	;
60	3C	<	\textless	<
61	3D	=	=	=
62	3E	>	\textgreater	>
63	3F	?	?	?
64	40	@	@	@
65	41	A	A	A
66	42	B	B	B
67	43	C	C	C
⋮	⋮	⋮	⋮	⋮
90	5A	Z	Z	Z
91	5B	[	[	[
92	5C	\	\textbackslash	\char‘\\
93	5D	]	]	]
94	5E	^	\^{}	\^{}
95	5F	_	_	\char‘_
96	60	‘	‘	‘
97	61	a	a	a
98	62	b	b	b
99	63	c	c	c
⋮	⋮	⋮	⋮	⋮
122	7A	z	z	z
123	7B	{	\{	\char‘\{
124	7C	|	\textbar	|
125	7D	}	\}	\char‘\}
126	7E	~	\~{}	\~{}

The following are some additional notes about the contents of Table 328:

- "" is not available in the OT1 font encoding.
- Table 328 shows a close quote for character 39 for consistency with the open quote shown for character 96. A straight quote can be typeset using `\textquotesingle` (cf. Table 40).
- The characters "<", ">", and "|" do work as expected in math mode, although they produce, respectively, "¡", "¿", and "—" in text mode when using the OT1 font encoding.[13] The following are some alternatives for typesetting "<", ">", and "|":
  - Specify a document font encoding other than OT1 (as described on page 8).
  - Use the appropriate symbol commands from Table 2 on page 9, viz. `\textless`, `\textgreater`, and `\textbar`.
  - Enter the symbols in math mode instead of text mode, i.e., `$<$`, `$>$`, and `$|$`.

  Note that for typesetting metavariables many people prefer `\textlangle` and `\textrangle` to `\textless` and `\textgreater`; i.e., "⟨*filename*⟩" instead of "<*filename*>".

[13] Donald Knuth didn't think such symbols were important outside of mathematics so he omitted them from his text fonts.

- Although "/" does not require any special treatment, LaTeX additionally defines a `\slash` command which outputs the same glyph but permits a line break afterwards. That is, "`increase/decrease`" is always typeset as a single entity while "`increase\slash{}decrease`" may be typeset with "increase/" on one line and "decrease" on the next.

- `\textasciicircum` can be used instead of `\^{}`, and `\textasciitilde` can be used instead of `\~{}`. Note that `\textasciitilde` and `\~{}` produce raised, diacritic tildes. "Text" (i.e., vertically centered) tildes can be generated with either the math-mode `\sim` command (shown in Table 67 on page 30), which produces a somewhat wide "∼", or the textcomp package's `\texttildelow` (shown in Table 40 on page 20), which produces a vertically centered "~" in most fonts but a baseline-oriented "˜" in Computer Modern, txfonts, pxfonts, and various other fonts originating from the TeX world. If your goal is to typeset tildes in URLs or Unix filenames, your best bet is to use the url package, which has a number of nice features such as proper line-breaking of such names.

- The various `\char` commands within `\texttt` are necessary only in the OT1 font encoding. In other encodings (e.g., T1), commands such as `\{`, `\}`, `\_`, and `\textbackslash` all work properly.

- The code page 437 (IBM PC) version of ASCII characters 1 to 31 can be typeset using the ascii package. See Table 227 on page 72.

- To replace "‘" and "’" with the more computer-like (and more visibly distinct) "`" and "'" within a `verbatim` environment, use the upquote package. Outside of `verbatim`, you can use `\char18` and `\char13` to get the modified quote characters. (The former is actually a grave accent.)

Similar to Table 328, Table 329 on the next page is an amalgamation of data from other tables in this document. While Table 328 shows how to typeset the 7-bit ASCII character set, Table 329 shows the Latin 1 (Western European) character set, also known as ISO-8859-1.

The following are some additional notes about the contents of Table 329:

- A "(tc)" after a symbol name means that the textcomp package must be loaded to access that symbol. A "(T1)" means that the symbol requires the T1 font encoding. The fontenc package can change the font encoding document-wide.

- Many of the `\text...` accents can also be produced using the accent commands shown in Table 17 on page 14 plus an empty argument. For instance, `\={}` is essentially the same as `\textasciimacron`.

- The commands in the "LaTeX 2_ε" columns work both in body text and within a `\texttt{...}` command (or, more generally, when `\ttfamily` is in effect).

- The "£" and "$" glyphs occupy the same slot (36) of the OT1 font encoding, with "£" appearing in italic fonts and "$" appearing in roman fonts. A problem with LaTeX's default handling of this double-mapping is that "`{\sffamily\slshape\pounds}`" produces "*$*", not "*£*". Other font encodings use separate slots for the two characters and are therefore robust to the problem of "£"/"$" conflicts. Authors who use `\pounds` should select a font encoding other than OT1 (as explained on page 8) or use the textcomp package, which redefines `\pounds` to use the TS1 font encoding.

- Character 173, `\-`, is shown as "-" but is actually a discretionary hyphen; it appears only at the end of a line.

Microsoft® Windows® normally uses a superset of Latin 1 called "Code Page 1252" or "CP1252" for short. CP1252 introduces symbols in the Latin 1 "invalid" range (characters 128–159). Table 330 presents the characters with which CP1252 augments the standard Latin 1 table.

The following are some additional notes about the contents of Table 330:

- As in Table 329, a "(tc)" after a symbol name means that the textcomp package must be loaded to access that symbol. A "(T1)" means that the symbol requires the T1 font encoding. The fontenc package can change the font encoding document-wide.

- Not all characters in the 128–159 range are defined.

- Look up "euro signs" in the index for alternatives to `\texteuro`.

While too large to incorporate into this document, a listing of ISO 8879:1986 SGML/XML character entities and their LaTeX equivalents is available from `http://www.bitjungle.com/~isoent/`. Some of the characters presented there make use of isoent, a LaTeX 2ε package (available from the same URL) that fakes some of the missing ISO glyphs using the LaTeX `picture` environment.[14]

8.7 Unicode characters

Unicode is a "universal character set"—a standard for encoding (i.e., assigning unique numbers to) the symbols appearing in many of the world's languages. While ASCII can represent 128 symbols and Latin 1 can represent 256 symbols, Unicode can represent an astonishing 1,114,112 symbols.

Because TeX and LaTeX predate the Unicode standard and Unicode fonts by almost a decade, support for Unicode has had to be added to the base TeX and LaTeX systems. Note first that LaTeX distinguishes between *input* encoding—the characters used in the `.tex` file—and *output* encoding—the characters that appear in the generated `.dvi`, `.pdf`, etc. file.

Inputting Unicode characters

To include Unicode characters in a `.tex` file, load the ucs package and load the inputenc package with the utf8x ("UTF-8 extended") option.[15] These packages enable LaTeX to translate UTF-8 sequences to LaTeX commands, which are subsequently processed as normal. For example, the UTF-8 text "`Copyright © 2009`"—"`©`" is not an ASCII character and therefore cannot be input directly without packages such as ucs/inputenc—is converted internally by inputenc to "`Copyright \textcopyright{} 2009`" and therefore typeset as "Copyright © 2009".

The ucs/inputenc combination supports only a tiny subset of Unicode's million-plus symbols. Additional symbols can be added manually using the `\DeclareUnicodeCharacter` command. `\DeclareUnicodeCharacter` takes two arguments: a Unicode number and a LaTeX command to execute when the corresponding Unicode character is encountered in the input. For example, the Unicode character "degree celsius" ("℃") appears at character position U+2103.[16] However, "`℃`" is not one of the characters that ucs and inputenc recognize. The following document shows how to use `\DeclareUnicodeCharacter` to tell LaTeX that the "`℃`" character should be treated as a synonym for `\textcelsius`:

```
\documentclass{article}
\usepackage{ucs}
\usepackage[utf8x]{inputenc}
```

[14] isoent is not featured in this document, because it is not available from CTAN and because the faked symbols are not "true" characters; they exist in only one size, regardless of the body text's font size.

[15] UTF-8 is the 8-bit Unicode Transformation Format, a popular mechanism for representing Unicode symbol numbers as sequences of one to four bytes.

[16] The Unicode convention is to express character positions as "U+⟨*hexadecimal number*⟩".

```
\usepackage{textcomp}

\DeclareUnicodeCharacter{"2103}{\textcelsius}   % Enable direct input of U+2103.

\begin{document}
It was a balmy 21℃.
\end{document}
```

which produces

> It was a balmy 21℃.

See the ucs documentation for more information and for descriptions of the various options that control ucs's behavior.

Outputting Unicode characters

Orthogonal to the ability to include Unicode characters in a LaTeX input file is the ability to include a given Unicode character in the corresponding output file. By far the easiest approach is to use XeLaTeX instead of pdfLaTeX or ordinary LaTeX. XeLaTeX handles Unicode input and output natively and can utilize system fonts directly without having to expose them via `.tfm`, `.fd`, and other such files. To output a Unicode character, a XeLaTeX document can either include that character directly as UTF-8 text or use TeX's `\char` primitive, which XeLaTeX extends to accept numbers larger than 255.

Suppose we want to output the symbols for versicle ("℣") and response ("℟") in a document. The Unicode charts list "versicle" at position U+2123 and "response" at position U+211F. We therefore need to install a font that contains those characters at their proper positions. One such font that is freely available from CTAN is Junicode Regular (`Junicode-Regular.ttf`) from the junicode package. The fontspec package makes it easy for a XeLaTeX document to utilize a system font. The following example defines a `\textjuni` command that uses fontspec to typeset its argument in Junicode Regular:

```
\documentclass{article}
\usepackage{fontspec}

\newcommand{\textjuni}[1]{{\fontspec{Junicode-Regular}#1}}

\begin{document}
We use ``\textjuni{\char"2123}'' for a versicle
and ``\textjuni{\char"211F}'' for a response.
\end{document}
```

which produces

> We use "℣" for a versicle and "℟" for a response.

(Typesetting the entire document in Junicode Regular would be even easier. See the fontspec documentation for more information regarding font selection.) Note how the preceding example uses `\char` to specify a Unicode character by number. The double quotes before the number indicate that the number is represented in hexadecimal instead of decimal.

8.8 About this document

History David Carlisle wrote the first version of this document in October, 1994. It originally contained all of the native LaTeX symbols (Table 44, Table 57, Table 67, Table 102, Table 128, Table 131, Table 152, Table 153, Table 164, Table 169, Table 201, and a few tables that have since been reorganized) and was designed to be nearly identical to the tables in Chapter 3 of Leslie Lamport's book [Lam86]. Even the table captions and the order of the symbols within each table matched! The $\mathcal{A}\mathcal{M}\mathcal{S}$ symbols (Table 45, Table 68, Table 69, Table 105, Table 106, Table 132, Table 137, Table 148, and Table 202) and an initial Math Alphabets table (Table 213) were added thereafter. Later, Alexander Holt provided the stmaryrd tables (Table 46, Table 59, Table 70, Table 108, Table 125, and Table 149).

In January, 2001, Scott Pakin took responsibility for maintaining the symbol list and has since implemented a complete overhaul of the document. The result, now called, "The Comprehensive LaTeX Symbol List", includes the following new features:

- the addition of a handful of new math alphabets, dozens of new font tables, and thousands of new symbols
- the categorization of the symbol tables into body-text symbols, mathematical symbols, science and technology symbols, dingbats, ancient languages, and other symbols, to provide a more user-friendly document structure
- an index, table of contents, hyperlinks, and a frequently-requested symbol list, to help users quickly locate symbols
- symbol tables rewritten to list the symbols in alphabetical order
- appendices providing additional information relevant to using symbols in LaTeX
- tables showing how to typeset all of the characters in the ASCII and Latin 1 font encodings

Furthermore, the internal structure of the document has been completely altered from David Carlisle's original version. Most of the changes are geared towards making the document easier to extend, modify, and reformat.

Build characteristics Table 331 lists some of this document's build characteristics. Most important is the list of packages that LaTeX couldn't find, but that `symbols.tex` otherwise would have been able to take advantage of. Complete, prebuilt versions of this document are available from CTAN (`http://www.ctan.org/` or one of its many mirror sites) in the directory `tex-archive/info/symbols/comprehensive`. Table 332 shows the package date (specified in the `.sty` file with `\ProvidesPackage`) for each package that was used to build this document and that specifies a package date. Packages are not listed in any particular order in either Table 331 or Table 332.

Index

If you're having trouble locating a symbol, try looking under "T" for "`\text`...". Many text-mode commands begin with that prefix. Also, accents are shown over/under a gray box (e.g., "◌́" for "`\'`").

Some symbol entries appear to be listed repeatedly. This happens when multiple packages define identical (or nearly identical) glyphs with the same symbol name.[17]

[17] This occurs frequently between amssymb and mathabx, for example.
